STATE PROJECT: 6.499002T (R-2413C)
FEDERAL PROJECT: N/A
COUNTY: Guilford and Rockingham

DESCRIPTION: NC 68 Connector - US 220 from South of Haw River to the Intersection of US 220 and Existing NC 68

SUBJECT: Geotechnical Report - Inventory

The project is located in northern Guilford and southern Rockingham Counties. US 220 is to be upgraded to a four-lane facility from south of the Haw River to NC 68. The total length of the project is 8.16 kilometers. Construction will include two reinforced concrete box culverts and five structures.

A field reconnaissance and subsurface investigation was conducted from November 1996 to May 1997 utilizing CME-45B, and CME-550 drill machines. Subsurface data was obtained by hand, solid, and hollow stem auger borings, with the use of Standard Penetration Tests at select locations. Soil samples were submitted for laboratory analysis by the Materials and Tests Unit.

Subsurface information is provided for the following alignments.

PHYSIOGRAPHY AND GEOLOGY

The topography of the area is gently rolling to hilly, with a maximum relief of 54 meters and a greatest local relief of 53 meters. Drainage along the project is collected into two river basins, the Dan River basin, north of NC 65, which drains to the north-northeast, and the Haw River basin, south of NC 65, which drains to the east-northeast. Drainage along the southern part of the project is relatively poor, causing water to collect in the relatively low and flat Troublesome Creek and Haw River flood plains. Drainage along the northern portion of the project is good. Along the project, drainage is structurally controlled by the northeast strike of the bedrock foliation.

Geologically, the project is underlain by schists and gneisses of the Milton Belt and a granitic intrusion of the Charlotte Belt. Most prominent on the project, is intrusive igneous granitic rock. The bedrock is covered by saprolite and other residuum, and a substantial alluvial deposit in the flood plain of the Haw River.

SOIL PROPERTIES

Residual soils on the project consist predominantly of yellow to brown-gray sandy silt and silt (A-4, A-5), and silty sand (A-2-4). Silty to sandy clay and clay (A-6, A-7), and clayey sand and sand (A-2-6 and A-1-b) are also locally present. Cap or surface clays extend to an average depth of approximately one meter but are absent in some areas. These clays vary in plasticity, with plastic indices from 12 to 41. Subsoils are saprolitic and slightly micaceous. Soil densities for silts and clays range from medium stiff to hard, and for sands, loose to very dense. Natural moisture contents of residual soils vary from 16% to 35%. The majority of soils encountered during construction will have moisture contents slightly greater than the optimum of 20%. Natural moistures of the soils vary with the season, depth of bedrock, and permeability.

Alluvial soils are present along several alignments at the following locations. The approximate lateral alluvial limits are drawn on the plans.

Line	Station
-LRev-	22+75 - 25+30
-LRev-	56+38 - 56+76
-LRev-	76+77 - 77+02
-SB US 220 Ramp-	10+18 - 11+67
-NB US 220 Ramp-	15+27 - 15+78
-Y25-	10+58 - 10+89

The Haw River flood plain is intersected by -LRev-, SB US 220 and NB US 220 Ramps. The flood plain is up to 255 meters wide with alluvial deposits up to 3 to 4 meters in thickness. The alluvial soils consist of interlayered saturated loose sand (A-2-4), soft sandy silt (A-4, A-5) and clay (A-7, A-6). The liquid limits of the cohesive soils range from 37 to 42 indicating these soils are moderately compressible. The ground surface, in

most areas of this flood plain, is soft and unstable under heavy equipment and may result in construction problems. The alluvium overlies very stiff and dense residuum.

Troublesome Creek and other tributaries are intersected by -LRev- and -Y25-. The flood plains are approximately 30 meters wide with alluvial deposits up to 1.5 meters in thickness. The alluvium consists of silty sand (A-2-4) and sandy silt (A-4). These soils are underlain by hard rock (granite).

Alluvium is also present along the tributary of Jacob's Creek north of NC 65. The loose alluvial sand (A-2-4) and soft silt (A-4) is less than 1 meter thick and overlies hard rock (granite).

Roadway embankment soils are present along fill sections of the existing roads and are comprised of material derived from the local residuum. An abandoned road intersects -LRev- Station 22+00, and 26+00, and SB US 220 Ramp Station 10+40 - 12+00. This embankment material consists of soft, non-compacted brown sandy silt (A-4). The soil is "clean", it contains minimal to no debris. Some construction debris (broken asphalt and concrete) and household debris (asphalt shingles, old appliances...) is present at the ground surface along the abandoned road.

Artificial fill is present along Ramp B at US 158, Station 12+30 to 13+00. This soil fill is comprised of medium stiff, red-brown sandy clay (A-7-5, A-6). The soil is very similar to the surrounding residual soils and was likely placed during prior roadway construction activities. This artificial fill material is relatively "clean", it contains minimal to no debris. Numerous tires (household debris) are present at the ground surface within the proposed right of way.

ROCK PROPERTIES

The project traverses two distinct geologic belts. The first two-thirds of the project (-LRev- Station 18+20 - 60+00) is within the Charlotte Belt. This granitic rock of the Charlotte Belt is believed to be associated with the Churchland Pluton. The pluton creates a prominent ridge that is relatively resistant to erosion. The light gray to tan granite is composed of quartz, feldspars and biotite. Rock structure is generally massive and has a medium to coarse grained porphyritic texture.

Soft weathered and hard rock encountered along the project is a tan to gray granite. In the relatively upper-lying areas, the granite is present at depths of 6 to 10 meters. In the relatively low-lying and flood plain areas, the rock is present at shallow depths of 1 to 4 meters. The granite tends to weather to boulders. Numerous boulders, which vary in diameter from 1 to 4 meters, are present at the ground surface and within the residual soils. Hard rock boulders are most prevalent just north of the Haw River (-LRev- Station 29+00 -33+00).

The latter section of the project (-LRev- Station 60+00 - 97+10) is in the Milton Belt. This segment of the project is underlain by metamorphic rock, gneiss and schist. The rocks of the Milton Belt are less resistant to erosion and are overlain by a thicker cover of residuum. For this reason, very little rock was encountered in this segment. This section of the project also contains small local granitic intrusions.

GROUNDWATER

Groundwater was encountered intermittently through out the project. The water table is at shallow depths in all the relatively low-lying and flood plain areas of the project. In the upper-lying cut section at -LRev- Station 53+00, groundwater was encountered at shallow depths just above the hard rock. Very little groundwater was encountered in the latter segment of the project, beyond -LRev- Station 65+00.

GEOTECHNICAL DESCRIPTIVE ANALYSIS

This project will not be divided into segments for detailed descriptive purposes. Specific areas and details have been addressed where conditions necessitate.

ROCK DESCRIPTION

IN THE BROADEST MEANING, HARD ROCK IS CONSIDERED THAT INDURATED EARTH MATERIAL WHICH CANNOT BE SAMPLED BY CONVENTIONAL SOIL SAMPLING TOOLS OR TECHNIQUES. THE BOUNDARY BETWEEN SOIL AND ROCK IS ARBITRARY. TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF 'WEATHERED ROCK'. FOR THE PURPOSE OF THIS INVESTIGATION, THESE MATERIALS ARE DIVIDED AS FOLLOWS: NOTE: THIS IS NOT APPLICABLE TO NON-INDURATED COASTAL PLAIN SAND AND CLAY DEPOSITS.

WEATHERED ROCK (WR)		SOFT WEATHERED ROCK(SWR)	MATERIAL THAT CAN BE PENETRATED WITH SOME DIFFICULTY USING POWER AUGERS OR YIELDS SPT VALUES > 100 BLOWS BUT < SPT REFUSAL.
		HARD WEATHERED ROCK(HWR)	MATERIAL THAT CAN BE PENETRATED WITH GREAT DIFFICULTYY USING POWER AUGERS OR YIELDS SPT REFUSAL.*
HARD ROCK (HR)	CORED ROCK	INFERRED ROCK LINE**	MATERIAL, EXCEPT BOULDERS, THAT CANNOT BE PENETRATED BY POWER AUGERS, EXCEPT IN THIN LEDGES, AND REQUIRES ROCK CORING TOOLS FOR OBTAINING A SAMPLE.

*SPT REFUSAL ≧ 25 mm OF PENETRATION PER 50 BLOWS.

**AN INFERRED ROCK LINE INDICATES THE ESTIMATED BOUNDARY OF HARD ROCK AS JUDGED BY THE ENGINEERING GEOLOGIST. A FULL DESCRIPTION OF ROCK IS GIVEN INCLUDING:

CORE RECOVERY (REC.)-TOTAL LENGTH OF ROCK RECOVERED IN THE CORE BARREL DIVIDED

ROCK QUALITY DESIGNATION (RQD)-TOTAL LENGTH OF SOUND ROCK SEGMENTS RECOVERED THAT ARE LONGER THAN OR EQUAL TO 100 mm DIVIDED BY THE TOTAL LENGTH OF THE CORE RUN EXPRESSED AS A PERCENTAGE.

CAUTION NOTICE :

THE SUBSURFACE INFORMATION AND THE SUBSURFACE INVESTIGATION ON WHICH IT IS BASED WAS MADE FOR THE PURPOSE OF STUDY, PLANNING AND DESIGN, AND NOT FOR CONSTRUCTION OR PAY PURPOSES. SOME DATA OBTAINED MAY BE OMITTED FROM THIS RELEASE.

ADDITIONAL INFORMATION MAY BE AVAILABLE, INCLUDING, BUT NOT LIMITED TO THE FOLLOWING:

FIELD BORING LOGS
ROCK CORES
SOIL & ROCK TEST DATA
SUBSURFACE REPORT

THIS INFORMATION MAY BE VIEWED BY APPOINTMENT BY CONTACTING THE N. C. DEPARTMENT OF TRANSPORTATION, GEOTECHNICAL UNIT @ (919) 250-4088. NEITHER THE SUBSURFACE PLANS AND REPORTS NOR THE FIELD BORING LOGS, ROCK CORES, OR SOIL TEST DATA IS PART OF THE CONTRACT.

GENERAL SOIL AND ROCK STRATA DESCRIPTIONS AND INDICATED BOUNDARIES ARE BASED ON A GEOTECHNICAL INTERPRETATION OF ALL AVAILABLE SUBSURFACE DATA AND MAY NOT NECESSARILY REFLECT THE ACTUAL SUBSURFACE CONDITIONS BETWEEN BORINGS OR BETWEEN SAMPLED STRATA WITHIN THE BOREHOLE. THE LABORATORY SAMPLE DATA AND THE IN SITU (IN-PLACE) TEST DATA CAN BE RELIED ON ONLY TO THE DEGREE OF RELIABILITY INHERENT IN THE STANDARD TEST METHOD. THE OBSERVED WATER LEVELS OR SOIL MOISTURE CONDITIONS INDICATED IN THE SUBSURFACE INVESTIGATIONS ARE AS RECORDED AT THE TIME OF THE INVESTIGATION. THESE WATER LEVELS OR SOIL MOISTURE CONDITIONS MAY VARY CONSIDERABLY WITH TIME ACCORDING TO CLIMATIC CONDITIONS INCLUDING TEMPERATURES, PRECIPITATION AND WIND, AS WELL AS OTHER NON-CLIMATIC FACTORS.

THE BIDDER OR CONTRACTOR IS CAUTIONED THAT DETAILS SHOWN ON THE SUBSURFACE PLANS ARE PRELIMINARY ONLY AND IN MANY CASES THE FINAL DESIGN DETAILS ARE DIFFERENT. FOR BIDDING AND CONSTRUCTION PURPOSES, REFER TO THE CONSTRUCTION PLANS AND DOCUMENTS FOR FINAL DESIGN INFORMATION ON THIS PROJECT. THE DEPARTMENT DOES NOT WARRANT OR GUARANTEE THE SUFFICIENCY OR ACCURACY OF THE INVESTIGATION MADE, NOR THE INTERPRETATIONS MADE OR OPTIONS OF THE DEPARTMENT AS TO THE TYPE OF MATERIALS AND CONDITIONS TO BE ENCOUNTERED. THE BIDDER OR CONTRACTOR IS CAUTIONED TO MAKE SUCH INDEPENDENT SUBSURFACE INVESTIGATIONS AS HE DEEMS NECESSARY TO SATISFY HIMSELF AS TO CONDITIONS TO BE ENCOUNTERED ON THIS PROJECT. THE CONTRACTOR SHALL HAVE NO CLAIM FOR ADDITIONAL COMPENSATION OR FOR AN EXTENSION OF TIME FOR ANY REASON RESULTING FROM THE ACTUAL CONDITIONS ENCOUNTERED AT THE SITE DIFFERING FROM THOSE INDICATED IN THE SUBSURFACE INFORMATION.

NOTE - THE INFORMATION CONTAINED HEREIN IS NOT IMPLIED OR GUARANTEED BY THE N. C. DEPARTMENT OF TRANSPORTATION AS BEING ACCURATE NOR IT IS CONSIDERED TO BE PART OF THE PLANS, SPECIFICATIONS, OR CONTRACT FOR THE PROJECT.

NOTE - BY HAVING REQUESTED THIS INFORMATION THE CONTRACTOR SPECIFICALLY WAIVES ANY CLAIMS FOR INCREASED COMPENSATION OR EXTENSION OF TIME BASED ON DIFFERENCES BETWEEN THE CONDITIONS INDICATED HEREIN AND THE ACTUAL CONDITIONS AT THE PROJECT SITE.

NOTES:

REVISED 1-31-95 (METRIC)
