ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL. THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE THAT ONLY MINOR VESTIGES OF ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING

STATE PROJECT: Geotechnical Report - Inventory
F.A. PROJECT: 34821.1.5 (U-2525)
COUNTY: Guilford
DESCRIPTION: Greensboro Eastern Loop From US 29 North of Greensboro to SR 2303 (Lawndale Drive)

SUBJECT: Geotechnical Report - Inventory

Project Description

The project is part of the Greensboro Outer Loop along new alignment between US 29 north and SR 2303 (Lawndale Drive) in Greensboro, North Carolina (249+73 to 552+99.67 -L-). The total length of the project is 5.744 miles. Based on our review of cross sections provided by NCDOT, embankment fill heights of up to 75 feet are anticipated with cut depths of as much as 40 feet proposed. The project will also include improvements to multiple intersections along the alignment. The alignments investigated include -Y4-, -Y5-, -Y6-, -Y7-, -Y16-, -LACFLY-, -Y4LPA-, -Y4RPA-, -Y4LPC-, -Y4RPC-, -Y6LPA-, -Y6RPA-, -Y6LPC-, -Y6RPC-, -Y13RPA-, -Y13LPC-, -Y13LPD-, -Y13RPD-, -Y4DET-, -Y5DET- and -Y7DET-. In addition to these alignments the following culvert locations along -L- were investigated: STA 365+50, STA 382+25, STA 431+05, STA 472+14, and STA 493+30.

In order to explore the general subsurface conditions at the project site, S&ME drilled a total of 309 soil test borings as shown on Sheets 5 through 38 between November 3, 2015 and March 3, 2016. The borings locations were selected and located in the field by S&ME personnel using a handheld Global Positioning System (GPS) unit.

Five drill rigs were used to complete the project. Two track mounted Diedrich D-50 rigs, a track mounted CME-850 and two ATV Mounted, CME-550X drill rigs were used to advance the borings. Both hollow-stem, continuous flight augers and mud rotary drilling techniques were used. Standard Penetration Tests (SPT tests) were performed at designated intervals in the soil test borings in general accordance with ASTM D1586 to provide an index for estimating soil strength and density and to provide samples for soil classification. SPT tests were performed with a hydraulic automatic hammer (Autohammer). In addition, Cone Penetration Test (CPT) testing was performed to supplement the test boring data at 20 locations. All boreholes were backfilled with soil cuttings after drilling was completed.

The following alignments were investigated for this project:

Physiography, Geology and Surface Water

The project site is located in Guilford County to the north of Greensboro, North Carolina. The topography in the area is generally flat to gently rolling. The project area is generally wooded with some residential development. Grading associated with U-2525B, and the interchange between -L- and US 29 (-Y13-) is ongoing.

Geologically, the project area is located within the Carolina Slate Belt of the Piedmont Physiographic Province. Rock formations of the Carolina Slate Belt generally consist of felsic and mafic metavolcanic rocks and felsic igneous intrusions (intrusive rocks). Intrusive rocks range in composition from granites, quartz monzonites, granodiorites, quartz diorites, and diorites to gabbros. The intrusive rocks in this area generally weather to produce a relatively thin residual soil overburden consisting primarily of silts and possibly boulders. Below the soil overburden, the soil transitions rather abruptly to soft weathered rock and then to hard bedrock. In many locations, the transitional zone between soil and rock is not well defined. Locally the transitional zone is termed weathered rock (WR). For engineering purposes, weathered rock is considered as residual material in which standard penetration test N-values exceed 100 blows per foot.

Soil Properties

Generalized subsurface conditions for the project are described below. For more detailed soil descriptions and stratifications at a particular test location, the respective profile and cross section should be reviewed.

The soil test borings generally encountered roadway embankment material, artificial fill, alluvial soils, residual soils, weathered rock and crystalline rock to the boring termination depths.

Roadway Embankment Soils: Roadway embankment soils were encountered in some soil test to depths ranging from 1.5 to 22 feet below the existing ground surface. The roadway embankment

soils generally consisted of silty clays and clays (A-7-5 and A-7-6), silts (A-5), sandy silts (A-4), silty sand (A-2-4) and gravel (A-1). Consistencies/relative densities ranging from very loose to medium dense and very soft to very stiff were recorded in the roadway embankment soils. The roadway embankment soil samples selected for laboratory testing exhibit a liquid limit ranging from 31 to 59 and a plasticity index from 7 to 31.

Artificial Fill: Artificial fill soils are present in several sections of the project. These areas are listed in "Areas of Special Geotechnical Interest." The artificial fill was generally encountered to depths ranging from of 1.4 to 27 feet below the existing ground surface. The artificial fill soils generally consisted of silty clays and clays (A-7-5 and A-7-6), sandy clays (A-6), clayey silt (A-5), sandy silts (A-4), clayey sand (A-2-6), sand (A-2-4) and gravel (A-1). Consistencies/relative densities ranging from very loose to dense and very soft to hard were recorded in the artificial fill. The artificial fill soil samples selected for laboratory testing exhibit a liquid limit ranging from 48 to 62 and a plasticity index from 23 to 39.

Alluvial Soils: Alluvial soils were encountered in borings near existing drainage features from the existing ground surface or below the existing roadway embankment soils or artificial fill and extended to a depths ranging from 2 to 27 feet. These areas are listed in "Areas of Special Geotechnical Interest." The alluvial soils consisted of clay (A-7-6), sandy clays (A-6), silt (A-5), sandy silt (A-4) and silty sand (A-2-4) with consistencies/relative densities ranging from very loose to medium dense and very soft to very stiff. The alluvial soil samples selected for laboratory testing exhibit a liquid limit of 29 and a plasticity index of 10.

Residual Soils: Beneath the roadway embankment, artificial fill, and alluvial soils or at the ground surface, residual soils were encountered in most borings. The residual soils generally consisted of sandy clay (A-6), silty clays and clays (A-7-5 and A-7-6), sandy silts (A-4), silts (A-5) and sands (A-2-4). Consistencies/relative densities ranging from very loose to very dense and very soft to hard. The residual soil samples selected for laboratory testing exhibit a liquid limit ranging from 29 to 97 and a plasticity index from 4 to 53.

Weathered Rock: Weathered rock was encountered during the roadway investigation. It originates from the underlying metamorphosed granite and metamorphosed diorite. Weathered rock was encountered at elevations ranging from 732.4 to 835.9 feet. Refer to the "Areas of Geotechnical Interest" for areas of rock encountered within 6 feet of proposed grade.

Crystalline Rock: Crystalline rock was encountered during the roadway investigation and consists of metamorphosed granite and metamorphosed diorite. Crystalline rock was encountered at elevations ranging from 731.6 to 827.9 feet.

Ground Water

Ground water level measurements were attempted in the borings at the completion of drilling. Groundwater was typically greater than 10 feet below proposed grades in almost all borings throughout the project corridor. Areas that exhibit high groundwater are discussed in "Areas of Special Geotechnical Interest."

The depth of ground water beneath the ground surface will fluctuate with seasonal precipitation and may occur at higher times of the year above less permeable clayey soils or weathered rock materials.

Ponds

Several ponds occur on or near the project right of way. These ponds are listed by alignment, station, and offsets in the "Areas of Special Geotechnical Interest."

Water Wells

Several water wells occur on or near the project right of way. These ponds are listed by alignment, station, and offsets in the "Areas of Special Geotechnical Interest."
