ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WHEN TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT YIELDS SPT N VALUES > 100 BLOWS PER FOOT.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V. SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES 'CLUNK' SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCKS EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGISTS PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGISTS PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGISTS PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

F. A. PROJECT: BRZ-1309(2)
COUNTY: Swain

DESCRIPTION: Approaches to Bridge No. 106 on SR-1309 over Alarka Creek

SUBJECT: Geotechnical Report – Inventory

Project Description

This project is located in southwestern Swain County north of the community of Lauada and southwest of Bryson City. The project consists of the relocation of approaches to Bridge No. 106 approximately 70 feet upstream from the existing crossing. Construction will primarily entail the excavation of cut slopes left and right of centerline approaching 65 feet in height. Embankment placement is minimal. Two retaining walls are proposed to prevent the side slopes of fills from toeing up in the floodplain of Alarka Creek. Total length of this project is 0.189 miles.

A geotechnical investigation was conducted by private consultants during August and September of 2004 utilizing a CME-45 skid rig equipped with a manual hammer for Standard Penetration Testing (SPT). NXWL drill rod was used for the retrieval of rock core specimens.

The following survey lines were investigated.

Areas of Special Geotechnical Interest

1) *Hard Rock:* Hard rock dominates the majority of the proposed cut slopes. Hard rock was found or can be expected at or above grade in the following areas.

Line	Station Interval
-L-	14+50 – 16+50
-L-	19+00 – 23+00
-DRIVE-	10+50 – 12+00

Physiography and Geology

The project area is located in the Blue Ridge physiographic province. The terrain in the area is mountainous. The corridor is incised into a gorge with topographic relief over 300 feet. The area is drained primarily by Alarka Creek which flows into Fontana Lake approximately 3 miles from the beginning of the project.

The extensive rock along the corridor is identified as a biotite granitic gneiss unit that lies as an unconformity in the Blue Ridge Belt. Locally the rock approaches a quartz-monzonitic composition, rich in feldspar, quartz, and lesser mica. However, this rock unit is noted for its heterogeneity.

Rock Properties

Retrieved core specimens revealed generally high recovery numbers, but variable RQD (Rock Quality Designation) values. The core averaged fair (approximately 50%). Rock in the area has wavy foliation, and is closely fractured.

Geotechnical Descriptive Analysis of the Project

For descriptive purposes, this project is divided into segments based on cross-section development.

1) –L- Stations 13+00 to 17+00

This section involves cut slopes to be constructed to the left of the alignment centerline. Slopes along this interval will approach a height of 65 feet, and will be built out of approximately 10 feet of colluvium underlain by hard rock. The colluvium consists of sandy soil and large boulders. It should be noted that due to the size of boulders, excavation of the colluvium should be treated in the same manner as that of hard rock. Rock in this section is moderately severe to very slightly weathered and closely fractured at angles from 35 to 65 degrees.

2) -L- Stations 17+00 to 19+50

Bridge Span and approach fills.

3) -L- Stations 19+50 to 23+00

Cuts will be developed right of centerline through this interval, with a maximum height of ± 50 feet. As in the aforementioned cut interval, these excavations will be constructed in approximately 10 feet of colluvium deposited over hard rock. Boulders are not as widespread in this section, and hard rock possesses the same previously described characteristics.

4) -DRIVE- Stations 10+00 to 13+00

A drive is to be constructed to provide access to a private road, resulting in up to 60-foot high cuts built to the left of this alignment. Again, these excavations will be developed in 10 feet of colluvium and moderately weathered to fresh, moderately close to closely fractured hard rock.

5) Retaining Wall Stations 19+50, 21+50 to 23+00

The retaining walls will be founded in existing embankment and on hard rock. Embankment materials are comprised of 10 to 20 feet of loose to very dense sand, rock fragments, and boulders. The embankment has been placed on colluvial boulders, saprolite, medium dense sand, and hard rock. Coring was required to penetrate the colluvium.

Project Engineering Geologist
