ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES 'CLUNK' SOUND WHEN STRUCK. *IF TESTED, YIELDS SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FEET
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	> 4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.
EXTREMELY INDURATED	SHARP HAMMER BLOWS REQUIRED TO BREAK SAMPLE; SAMPLE BREAKS ACROSS GRAINS.

Physiography and Geology

The project follows existing alignment of NC 28 north of Franklin traversing a deeply weathered, partially incised peneplain in the broad valley of the Little Tennessee River. Just one creek is crossed in 2.4 miles. The area is suburban to bucolic in nature.

Scattered outcrops of gneissic bedrock are exposed at only one locality along the entire project. Encounters with crystalline rock in test borings were unusually sparse. Rock units attributed to the area by the Geologic Map of North Carolina (1985) include Late Proterozoic Age biotite gneiss possibly with abundant aluminosilicates labeled Zybn and amphibolite labeled Zyba. Parent material for the majority of the bedrock is most likely marine sediment derived from a volcanic landscape along with a lesser amount of intrusive and extrusive mafic igneous rock. All of which has been metamorphosed more than once. Intruded into the country rock are Devonian to Silurian age pegmatite swarms.

Numerous small mines in the pegmatites, now obscured, produced mica during the 1930s and 1940s are located along the project corridor. The largest mica mine in Macon County still can be seen along the banks of the river a few hundred feet beyond the end of the project.

Soil Properties

Most of the soils encountered along this project will be saprolitic and frequently straddle the boundary between sand and silt. Saprolitic soils on the project are predominately medium dense silty sand and medium stiff to stiff sandy silt. Typical of saprolites here is layering with weathered rock. This is noticeable in one of the larger cuts on the project right of -L- Stations 84+50 to 94+00.

Widespread residual soils are represented by immature A-5 silts on steeper slopes to intensely weathered A-7-5 clay caps. These soils reflect their volcanic heritage by having somewhat elevated liquid limits. Weathered bedrock clasts are common in residuum.

River terrace soils occupy high flat ground and where protected from erosion, can be 12 feet deep. Terrace clays are typically bright red in color and underlain by rounded basal quartz gravel and cobbles. Generally, these soils are classified as A-7-5 and A-5 and are nearly void of silt. These ancient alluvial soils are so intensely weathered that some are even classified as residual soils on soil surveys.

Incipient colluvial soils observed along the project include residual soils piled up at the toe of one steep slope (-L- Station 74+00, LT) and some clayey residuum in the head of a drainage at -L- Stations 67+50 to 74+00, RT and 184+50, RT. Small clasts of weathered bedrock incorporated in the residuum indicate some creeping movement has occurred in the past. Although these soils have some characteristics of colluvium (they have migrated downhill some) they have a greater resemblance to residuum and were classified so.

Alluvial soils are found mostly to the left of –L- Station 99+00 to 110+20 and on both sides of -Y6- from Station 11+50 to 12+50. Alluvium is typically 3 to 4 feet deep and dominated by very soft silts which tend to have just enough organic material to smell sulphurous and possess a dark brown color but have no peaty layers or wood debris. These very soft silts are labeled as organic on cross sections. Basal sand and gravel are intermittent. Alluvium is typically underlain by a soft clay plugged silty saprolite. Near the culvert by -L-Station 108+95, alluvium is underlain by crystalline rock.

Embankments are found along the roadway throughout the project. Some embankments have a moderate percentage of weathered rock mixed with the saprolitic borrow material used in their construction. Existing embankments appear to be in good condition.

Uncontrolled fill soil is noted in several areas. One is found right of -L- Station 83+50±. The fill was placed in a small intermittent drainage to allow for a parking area in the front yard of a residence. Patches of shallow fill soil (disturbed alluvial silts) were encountered along the creek left of -L- Station 101+00 to 107+00. Also, very soft silty fill was encountered in the low ground left of -L- Station 110+00.

Note: Areas denoted cross sections as saprolite with weathered rock layers or zones, or weathered rock interlayered with saprolite or crystalline rock may require select ripping or blasting to excavate.

Crystalline Rock Properties

Crystalline rock is exposed in only one area along the length of this project. Near the creek at -L- Station 109+00± and on the right side of -Y7-. Crystalline rock is only classified as having a metamorphic origin, i.e. gneiss.

Bulk Samples

A bulk sample was taken at the following cut location for tests to determine engineering properties of the soil.

Sample No.	Location	Depth

Vane Shear Results

A Geonor Vane Tester H-60 with a 1-inch vane (25.4 x 50.8 mm) was used. Gauge readings are multiplied by 0.5, values given are adjusted.

Geotechnical Descriptive Analysis

For descriptive purposes, the project has been divided into segments.

Segment 1: -L- Station 60+00 to 110+62

Small cuts and embankments are proposed from -L- Station 60+00 to 84+00. In this area, medium stiff to stiff fine grained residual soils (A-4, A-5, A-7-5) are underlain by medium stiff to very stiff clayey silts (A-5) to sandy silts (A-4) or medium dense silty sands (A-2-4). A small area of crystalline rock will be encountered in the cut right of -L- Stations 78+50 to 79+50 and right of Station -Y4- Station 15+00. There, crystalline rock and weathered rock are layered with dense saprolite.

Soils both left and right of -L- Station 67+50 to 76+00 have clasts of weathered rock in the argillic horizon. It is suspected that these soils have sagged slightly down-slope during past cold climates.

Uncontrolled fill with some wood and trash is present in a filled in drainage right of -L- Station 83+30 to 83+95. The fill may extend slightly under the proposed northbound lane.

Two drainfields were reported to be in the area of the proposed cut left of -Y6- Station 14+00± to 15+64± by the owner of the property, Gary Wayne Crisp.

One of the larger cuts along the project is to the right of -L- Station 86+00± to 98+00±. There, an immature residual horizon of stiff clayey sandy silt or sandy clay (A-5, A-6) typically less than 5 feet thick overlies loose to very dense saprolitic sands (A-2-4, A-2-5). Saprolitic soils are layered with weathered rock of gneiss.

The longest embankment proposed is from -L- Station 98+00± to 110+60±. It will be placed over existing embankment and saprolitic soil with some weathered rock of gneiss and spill out over floodplain soils. Alluvial soils encountered include very soft silts with organic characteristics. Vane shear tests were performed in these weak soils. Also, the top few feet of underlying saprolitic soils are plugged with clay and grey. Some of the area had standing water at the time of this investigation and the ground would sink under foot, particularly from -L- Station 99+00 to 101+00 near the toe of proposed embankment.

The stone culvert where NC 28 crosses Rocky Branch is in an area of shallow crystalline rock overlain by thin silty alluvium. Crystalline rock is exposed along portions of the creek bed there.

From -L- Station 104+00± to 110+20±, multiple generations of embankments serving numerous alignments of NC 28 are present.

Segment 2: -L- Station 110+62 to 188+50

A moderate cut extends on the left of -L- Station 111+00± to 117+00± where less than 5 feet of residual stiff sandy clay overlie fairly deep saprolitic medium dense to very dense silty sand and medium stiff to hard sandy silts layered with weathered rock of gneiss.

Crystalline rock was encountered in three borings left of -L- Station 112+00 to 115+00 at a depth of 31± to 39± feet.

Right of -L- Station 117+50 to 120+00 is a proposed embankment up to approximately 40 feet tall. Foundation materials include existing embankment and some recent alluvium. The embankment toes out in the head of a drainage where about 2 feet of washed in clayey silt overlies 5 feet of very soft recent alluvial sandy silt underlain by hard saprolitic silt. A spring box located approximately 100 feet right of -L- Station 118+65 is outside of construction limits.

Small cuts and embankments are typical for the majority of this section. Fairly deep medium stiff to very stiff residual clays and silty and/or terrace clays and silts (A-7-5, A-5) underlain by medium dense to very dense saprolitic sands and medium stiff to hard silts (A-4, A-2-4, A-2-5) are found in this section from -L- Station 120+00 to 185+50.

The very end of the project has a tall cut on the left from -L- Station 185+00± 188+20±. Surprisingly, no crystalline rock and very little weathered rock of gneiss was encountered in test borings there. The tall cut is composed predominantly of medium stiff to hard saprolitic silt (A-4) with a patchy residual cap of clayey silt (A-5).

A water well and pump house are reported to be to the right of -L- Station 184+00± – 185+00± on the property of Martha C. Donaldson.

-Y7-

Crystalline rock of gneiss is present in the proposed cut right of -Y7- Stations 11+25 to 12+40.
