1.1 INTRODUCTION

This report documents a Preliminary Site Assessment (PSA) conducted by URS Corporation – North Carolina (URS) on behalf of the North Carolina Department of Transportation (NCDOT). The assessment area includes a site located on the east bank of the Pigeon River on the north side of Park Street for project B-3656, Bridge 419 over the Pigeon River on US 19-23-74. This PSA was conducted in Canton, Haywood County, North Carolina (**Figure 1**) for the Town of Canton Property, located at 90 Park Street (the Site). The PSA was performed only within the proposed right-of-way and/or easement for this parcel. **Figure 2** shows the property relative to the proposed Bridge 419 project.
This PSA was performed in general accordance with:

- NCDOT's 29 January 2010 Request for Technical and Cost Proposal (RFP) for the Site property. The RFP established the following scope of work (SOW) for the project:
  - Locate underground storage tanks (USTs) and estimate approximate size and contents (if any).
  - Determine if contaminated soils are present.
  - If contamination is evident, estimate the quantity of impacted soils and indicate the approximate area of soil contamination on a Site map.
  - Prepare a report including field activities, findings, and recommendations for the Site and submit the report to NCDOT in triplicate.
- URS's 19 February 2010 Technical and Cost Proposal for the Site property.
- NCDOT's 2 March 2010 Notice to Proceed for the Site property.

The project included a geophysical survey, soil sampling using a direct push technology (DPT) rig, and laboratory analyses of selected soil samples from within Site property and laboratory analyses of a groundwater sample. The geophysical survey was first conducted by URS in order to identify potential UST and/or anomaly locations within the Site property. Based on the results of the geophysical survey and anecdotal evidence, boring locations were identified and the DPT borings were completed by a qualified drilling subcontractor (Probe Technology of Concord, North Carolina) under the supervision of a URS geologist. Soil borings were located in areas that were cleared of underground utilities by URS. Analysis of soil samples were performed by Prism Laboratories under direct contract with NCDOT.

1.2 BACKGROUND

The objective for this PSA is to assess the Site for USTs and impacted soil and to delineate potential impacts found in soils. The major Site features and the surrounding area are shown on **Figures 1** and **2**. The parcel is bounded by a construction easement with a pumping station and the Pigeon River to the west, Park Street to the south, vacant property to the east, and commercial property to the north. The property is currently a vacant lot. According to a 1945 Sanborn map (provided by NCDOT), a gas station operated over a portion of this site at one time. Sanborn maps show a laundry also operated in this area at one time in the past. According to NCDENR's UST Section database there are no known registered USTs or Groundwater Incidents associated with this site.

2.1 GEOPHYSICAL SURVEY

The primary objective of the geophysical survey was to locate potential USTs or anomalies within the property and a secondary objective was to mark the locations of underground utilities at the property in advance of the planned subsurface investigation. The geophysical survey for the property was conducted by URS between March 15 and 17, 2010. Ground surface conditions consisted primarily of concrete or asphalt.

The geophysical investigation was conducted using the electromagnetic (EM) method augmented by ground-penetrating radar (GPR). The EM survey was completed using the hand-held Fisher Labs GEMINI-3 and the Geonics, Ltd. EM-61 MKII (EM-61). The GPR survey was completed using a Sensors & Software, Inc. Noggin PLUS Smart Cart System with a 250 MHz scanning antenna.

URS utilized the GEMINI-3 to first conduct a broad search of the portions of the survey area not covered by reinforced concrete in order to identify anomalies indicative of USTs. EM-61 data were collected along parallel profiles with a nominal spacing of 3 feet and also extending across the portions of the survey area not covered with reinforced concrete. EM-61 data were recorded at a rate of 8 readings per second, which equates to an along-profile data point spacing of less than 1 foot. The GPR was used to conduct a broad search of the parcel in areas where metal detection methods proved unreliable.

A Trimble ProXRT global positioning system (GPS) was used to record positional data coincident with the EM-61 data. The ProXRT system provided real-time differential corrections via an Omnistar subscription service. The horizontal accuracy of the differential GPS (DGPS) data is generally 3 feet or better. URS also used the GPS system to record the locations of relevant site features within the survey area at Parcel #4.

URS performed in-field analysis of the EM-61 data to identify anomalies indicative of potential USTs. Preliminary interpretations were based on an evaluation of the magnitude of the EM response as well as the dimensions of the anomaly in plan view. URS utilized the ProXRT GPS to navigate to each potential UST location and temporarily marked these locations using semi-permanent marking paint. Follow-up GPR surveying was subsequently conducted across the EM-61 anomalies identified during in-field analysis in order to further characterize the shape and depth of the anomalies. Additional follow-up GPR surveying was conducted in the portion of the survey area along Park Street with suspected reinforced concrete because reinforced concrete can potentially mask the presence of USTs in EM-61 data.

The GPR survey consisted of in-field analysis of real-time data. No post-processing of the data was completed, although a representative GPR profile was saved to a data file.

Prior to conducting the GPR investigation, URS performed in-field analysis of the EM-61 data to identify anomalies indicative of potential USTs. Preliminary interpretations were based on an evaluation of the magnitude of the EM response as well as the dimensions of the anomaly in plan view.

The EM-61 data were pre-processed using the program DAT61 MK2 (Geonics Ltd). The program was used to prepare the data for contouring in Surfer (Golden Software, Inc.). Contoured data represent EM-61 Channel 1 and differential responses. The Channel 1 response represents data recorded at the earliest time interval along the EM-61 response decay curve.

These data are applicable to detection of subsurface objects including USTs and other underground obstructions (e.g. utility lines).

The differential response data were also processed for this survey because the effectiveness of the EM-61 for locating buried objects may be negatively affected by interference from metallic surface clutter and remnant cultural features (e.g. building foundations). Differential channel data typically provide enhanced discrimination between anomalies arising from surface or near-surface effects versus utilities and other potentially deeper targets of interest.

2.2 SOIL BORING INSTALLATION AND MEDIA SAMPLING

Sixteen Geoprobe® direct-push soil borings, P7-1 through P7-16, were installed on April 14 and 15, 2010 to assess the Site for impacted soil. Soil samples were collected and logged continuously at each soil boring location. Soil sample aliquots were field screened for organic vapors with a MiniRae® brand photo-ionization detection (PID) instrument calibrated daily with 100 parts per million (ppm) isobutylene.

Soil samples from select intervals were collected from each boring during the soil investigations for laboratory analysis. The samples were analyzed for Total Petroleum Hydrocarbons (TPH) as gasoline range organics (GRO) and diesel range organics (DRO) using USEPA Method 8015B. Additionally, as requested by NCDOT via email correspondence dated February 8, 2010, soil samples collected from the north western portion of Parcel 7 near the location of the former laundry facility (P7-11 through P7-16), were analyzed for volatile organic compounds (VOCs) by USEA Method 8260 and semi- volatile organic compounds (SVOCs) by USEPA Method 8270.

2.3 QUALITY CONTROL/QUALITY ASSURANCE PROCEDURES

While in the field, pertinent observations were recorded in a logbook maintained by the URS field representative. This included pertinent field data collection activities and other observations as appropriate. Each sample collected for laboratory analysis was assigned a unique sample identification number and placed in laboratory supplied containers appropriate for the parameters being analyzed. Samples collected for laboratory analyses were stored on ice in insulated coolers immediately following collection. Information on the custody, transfer, handling, and shipping of all samples was recorded on a chain-of-custody form that accompanied the samples to the laboratory.

Soil analytical data were evaluated based on the *Contract Laboratory Program National Functional Guidelines for Organic Data Review* (USEPA, October 1999). Sample results have been qualified based on the results of the data review process and are considered representative and valid for the purpose of this report.

3.1 GEOPHYSICAL SURVEY RESULTS

The results of this geophysical survey are presented in accordance with the NCDOT guidelines, dated May 19, 2009, for identifying and ranking potential USTs on NCDOT projects.

The results of the search with the GEMINI-3 indicated several large anomalies within the easement along Park Street as well as near the city maintained pumping station in the northwest corner of the survey area. These anomalies are consistent with the presence of buried remnant building foundations or near-surface metallic clutter. Therefore, USTs could not be readily identified with the GEMINI-3 due to elevated background noise.

The EM-61 Channel 1 and differential response results are provided as plan view, color-enhanced contour maps in **Figures 3A** and **3B**, respectively. The interpreted background response is represented by the light green contours and corresponds to the range of 0 to 25 milliVolts (mV). Elevated EM-61 responses represented by the blue contour interval are interpreted to be smaller near-surface metallic objects or metal objects buried at greater depths. The highest EM responses represented by the range of responses in the pink to red interval in **Figures 3A** and **3B** as well as negative EM responses are interpreted to be large metal objects. Sources of known EM interference are annotated accordingly on **Figures 3A** and **3B**, and linear features indicative of underground utilities are identified with black dashed lines. It is important to note that utility center lines are identified in **Figures 3A** and **3B** only where the EM-61 data or visible site features (e.g. cut in concrete) support this level of interpretation.

The Channel 1 results in **Figure 3A** appear to be consistent with the GEMINI-3 blind search results and indicate the likely presence of large cultural features (e.g. buried concrete slabs, remnant foundations) likely associated with the former gas station. The differential response results in **Figure 3B** appear to have effectively minimized the effect from these near-surface features and have accentuated the anomalies most likely indicative of USTs. Anomalies targeted for follow-up surveying with GPR were identified using the differential response contours presented in **Figure 3B**. However, development of a subsurface investigation plan or excavations should refer to both **Figures 3A** and **3B**.

Follow-up GPR surveying was subsequently conducted across EM-61 anomalies in **Figure 3B** that could not be attributed to surface features and that exhibited both plan-view dimensions and EM response magnitudes consistent with USTs. Cross-sections K-K' through N-N' on **Figures 3A** and **3B** depict the locations of representative profiles collected and stored as part of the follow-up GPR survey.

The results of the follow-up GPR survey are presented as **Figure 3C**. The majority of the cross-sections appear to be consistent with the EM-61 Channel 1 and GEMINI-3 results and further indicate the presence of near-surface features likely associated with the former gas station. For example, the relatively garbled appearance of the GPR reflections in cross-section N-N' on **Figure 3C** is characteristic of buried concrete or asphalt slabs, remnant foundations, or debris. Cross-section M-M' depicts three potential side-by-side USTs at an estimated depth of 4 feet at Parcel #7. These suspected USTs were identified within the vicinity of the observed fill port, and as a result, these suspected USTs are categorized as "Probable USTs" in accordance with the NCDOT guidelines.

The parabolic shape of the anomaly in cross-section M-M' in **Figure 3C** suggests that the long axis of the probable USTs is oriented parallel to Park Street. The brown rectangles shown in **Figures 3A** and **3B** depict the extents of the suspected USTs based on the GPR survey. **Figure 3C** also presents a photograph of the three side-by-side probable USTs. The fill port was circled in blue marking paint on-site, as shown in the accompanying photograph on **Figure 3C**. Although the remaining cross-sections in **Figure 3C** do not indicate the presence of USTs, it should be noted that deterioration of a UST over time may result in muting of the characteristic GPR reflection patterns typical of USTs. Therefore, intrusive investigations of the additional EM-61 anomalies at Parcel #7 may be warranted in the future.

3.2 SOIL SAMPLING RESULTS

A total of sixteen soil borings were advanced to depths of approximately 10 ft bgs during the PSA investigation at the Site property. Boring locations are shown in **Figure 4** and analytical results (TPH) are summarized in **Table 1**. The soil was described as brown to brown and gray sandy silt/clay. The boring logs are included as **Appendix A** and the complete laboratory report is included in **Appendix B.**

TPH (DRO) was not detected in any of the soil samples submitted for laboratory analysis. Low-level estimated concentrations of TPH (GRO) were reported in all sixteen samples. If the USTs are removed, it is anticipated that only a limited amount of impacted soils (one to two truckloads) would be encountered and need to be properly disposed.

VOCs and SVOCs were not detected in the samples submitted for laboratory analysis for the investigation of soil impacts in what is thought to be the vicinity of the former laundry (P7-11 through P7-16). Acetone, a common laboratory contaminant was reported in most of the samples.

Opinions relating to environmental, geologic, and geotechnical conditions at this parcel are based on limited data, and actual conditions may vary from those encountered at the times and locations where the data was obtained, despite the use of due professional care. The geophysical investigation was conducted in accordance with reasonable and accepted engineering geophysics practices, and the interpretations and conclusions are rendered in a manner consistent with other consultants in our profession. All geophysical techniques have some level of uncertainty and limitations. No other representations of the reported information is expressed or implied, and no warranty or guarantee is included or intended. The results of the geophysical survey are presented in accordance with the NCDOT guidelines, dated May 19, 2009, for identifying and ranking potential USTs on NCDOT projects.

Appendix B
Laboratory Report

PRISM LABORATORIES, INC.
Full-Service Analytical & Environmental Solutions

NC Certification No. 402
SC Certification No. 99012
NC Drinking Water Cert No. 37735

Case Narrative

05/10/2010

URS Corp Morrisville (NCDOT)
Martha Myers-Lee
1600 Perimeter Park Dr. Suite 400
Morrisville, NC 27560

Project: NCDOT: Canton, NC (Parcel 7)
Project No.: WBS# 3.3202.1.2
Lab Submittal Date: 04/16/2010
Prism Work Order: 0040148

This data package contains the analytical results for the project identified above and includes a Case Narrative, Sample Results and Chain of Custody. Unless otherwise noted, all samples were received in acceptable condition and processed according to the referenced methods.

Data qualifiers are flagged individually on each sample. A key reference for the data qualifiers appears at the end of this case narrative.

Narrative Notes:

THIS IS A REVISED REPORT AND SUPERCEDES THE ORIGINAL LAB REPORT DATED 4/30/10. ADDED TOTAL XYLENES TO METHOD 8260B. ETHANOL NOT REPORTABLE DUE TO POOR PURGE EFFICIENCY.

Analysis note for Method 8270 (Prism Sample 0040148-07, -08, and -09): Reporting Limits raised due to thick, dark matrix.

Please call if you have any questions relating to this analytical report.

Respectfully,

PRISM LABORATORIES, INC.

President/Project Manager

Reviewed By

Data Qualifiers Key Reference:

J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
Aa	Surrogate above the control limits. GRO was not detected in the sample. No further action was taken.
A	MSD Surrogate recovery outside control limits.
BRL	Below Reporting Limit
MDL	Method Detection Limit
RPD	Relative Percent Difference
*	Results reported to the reporting limit. All other results are reported to the MDL with values between MDL and reporting limit indicated with a J.
