1.0 INTRODUCTION

In accordance with the North Carolina Department of Transportation (NCDOT) Request for Proposal, dated November 3, 2010, AMEC Earth and Environmental, Inc. of North Carolina (AMEC) has performed a Preliminary Site Assessment (PSA) for the Earl C. Edward Property (the Site) to be effected by a road improvement project along Old NC 18 and Old Shelby Rd. The Site, which is located on 403 Old NC 18, currently operates as a gas station and convenience store called Tobacco Barn #2. It is identified as Parcel #61 within the NCDOT U-2551 design project. The property is located on the northeastern corner of the intersection of Old NC 18 and Old Shelby Rd, north of I-40, which is in Morganton of Burke County, North Carolina. The investigation was conducted in accordance with AMEC's Technical and Cost proposal dated November 3, 2010.

NCDOT contracted AMEC to perform a PSA on the Earl C. Edward Property due to the Underground Storage Tank (UST) section registry showing that three USTs are currently on site, with additional tanks previously removed in 1992. Soil contamination was encountered during the UST removal and the property has since been remediated. This PSA was performed to determine if soils remain or have since been impacted by petroleum compounds and volatile organic compounds as a result of past and present uses of the property within the proposed expanded right-of-way (ROW).

The following report describes our field investigations and results of chemical analyses. It includes the evaluation of the analytical data with regards to the presence or absence of soil contamination within the proposed ROW and estimates the extent of soil contamination.

1.1 Site Location and History

The Earl C. Edward Property parcel is located on the northeastern corner of the intersection of Old NC 18 and Old Shelby Rd, north of I-40 in Morganton, Burke County, North Carolina. It is located within the metamorphic sediments of the Inner Piedmont Physiographic Province of western North Carolina. Figure 1 shows the site location and vicinity.

AMEC studied the NCDENR UST Registered Tanks Database which listed that one kerosene tank with a capacity of 4,000 gallons and two gasoline tanks, with 8,000 and 10,000 gallons in capacity were installed at Tobacco Barn #2 at 401 Old Shelby Rd. on October 18, 1991. All three tanks are currently operational according to the NCDENR Database. AMEC also reviewed the NCDENR Incident Management Database and noted that was no other information associated with this address. There were two USTs mentioned in the NCDOT RFP as being previously removed from this parcel but AMEC discovered that they were associated with nearby address and not Parcel #61.

1.2 Site Description

The Site is currently operating as a gas station with convenience store and grill. The convenience store and grill are both within one building. The grill occupies the northern end of the building and has a wooden deck for seating. The gas station and convenience store occupies the southern and central portion of the building. The dispensers are sheltered under a detached canopy. The dispensers are aligned down the center of the canopy each with its own concrete base or island. The proposed DOT project will impact the southern and western property edges of Parcel #61 along Old Shelby Rd and Old NC 18. Three USTs were observed at this facility and are located in a large tank bed south of the canopy and beyond the ROW. The three tanks are positioned perpendicular to the Tobacco barn. Appendix A includes a photo log for Parcel #61. AMEC personnel noted that four monitoring wells were accessible for groundwater measurement. Their depths to water ranged from 39.1 to 42.5 feet below top of casing.

The surrounding properties are residential, commercial, agricultural and municipal. The parcel directly across Old NC 18 and to the south is the Healthy Petz Veterinarian. The properties to the southeast, east and north are residential. The southeastern property has multi-tenant housing. The eastern and northern properties have single family homes. A gas easement runs between Parcel #61 and the property to the north. The property to the west which is directly across Old Shelby Rd belongs to Western Piedmont Community College (WPCC). The WPCC campus contains an animal hospital and agricultural land containing livestock.

2.0 GEOLOGY

2.1 Regional Geology

The Earl C. Edward Property is located within the metamorphic sediments of the Inner Piedmont Physiographic Province of western North Carolina. The Inner Piedmont belt is the most intensely deformed and metamorphosed segment of the Piedmont. The metamorphic rocks range from 500 to 750 million years in age. They include gneiss and schist that have been intruded by younger granitic rocks. The northeast-trending Brevard fault zone forms much of the boundary between the Blue Ridge and Inner Piedmont belts.

2.2 Site Geology

Site geology was observed through the sampling of 7 shallow direct push probe soil borings (SB) onsite. Borings were extended until 10 feet (ft) below ground surface (bgs). Native soils generally consisted of orange, well sorted and clayey silt. Boring logs are presented in Appendix B.

Damp soil conditions were typically first encountered at a depth of 0.5 ft bgs.

3.0 FIELD ACTIVITIES

3.1 Preliminary Activities

Prior to commencing field sampling activities at the site, several tasks were accomplished in preparation for the subsurface investigation. The Health and Safety Plan (HSP) was modified to include the site-specific health and safety information necessary for the field activities. On December 2, 2010 a private utility locating company, Priority Underground Locating of Huntersville, North Carolina cleared the proposed drilling locations that were marked in the field by AMEC personnel. North Carolina-1-Call was contacted on December 6 to report the proposed drilling activities and subsequently notify all affected utilities for the parcel. Carolina Soil Investigations, LLC (CSI Drilling) of Olin, North Carolina was retained by AMEC to perform the direct push sampling for soil borings. AMEC coordinated with Schnabel Engineering South (Schnabel) who performed two geophysical surveys (electromagnetic and ground penetrating radar) onsite during

December. The geophysical results were reviewed and discussed at the completion of each survey. Prism Laboratories, Inc. was contacted for acquisition of sample bottles.

3.2 Site Reconnaissance

AMEC personnel completed site reconnaissance on November 11, 2010. During reconnaissance, the area was visually examined for the presence of any UST or areas/obstructions that could potentially affect the subsurface investigation and the number of boring locations was discussed. Boring locations were marked on December 2, 2010.

3.3 Geophysical Survey

Schnabel performed the geophysical surveys on December 1 and 2, 2010. Schnabel utilized a Geonics EM61-MK2 to perform the electromagnetic induction surveys and a Geophysical Survey Systems SIR-3000 to conduct the ground-penetrating radar (GPR) investigations. These instruments are specifically calibrated to detect metal anomalies that are buried deeply and are characteristically large. The data collected by Schnabel did not indicate the presence of metallic USTs in the area surveyed. The complete report can be found in Appendix C.

3.4 Well Survey

No well survey was performed as part of this PSA.

3.5 Soil Sampling

Soil boring occurred on December 8, 2010 at Parcel #61. Seven direct push soil borings were conducted within the proposed expanded ROW on Parcel #61, which includes the southern and western parcel edges. Figure 2 presents the Site Map with boring locations and identifications. These samples were located to optimize the likelihood of intercepting any potential soil contamination by including as much area as possible. The first boring P61-SB-1 was placed just on the north end of the parcel. Subsequent soil borings P61-SB-2 through P61-SB-7 were aligned progressing toward the south and east in a staggered pattern. Underground utilities prevented much lateral movement. Boring locations did not exhibit elevated PID readings; therefore AMEC personnel believed to have had adequate coverage of the site.

Soil samples were collected in accordance with EPA protocols in laboratory-supplied containers. The soil samples for Total Petroleum Hydrocarbons (TPH) –Gasoline Range Organics (GRO) analysis were collected using the 5030 prep method with methanol preservation. Samples for TPH-Diesel Range Organics (DRO) analysis were collected in 4oz. glass containers. Samples for Volatile Organic Compounds (VOC) analysis were collected using the EPA Method 8260. Once placed in the containers, the samples were labeled with the sample number, time of collection, date of collection, name of the collector, and the requested analysis. The samples were packed on ice, and then hand delivered to Prism Laboratories in Charlotte, a North Carolina Certified Laboratory following proper chain-of-custody procedures.

4.0 SOIL SAMPLING RESULTS

AMEC conducted soil sampling at the Site on December 8, 2011. The purpose of the sampling was to determine if releases of petroleum hydrocarbons had occurred, and if so, to estimate the volume of soil that might require special handling during construction activities. The sampling was accomplished using direct push methods accompanied by field screening for organic vapors with a PID. The laboratory results with PID readings are tabulated in Table 1.

One soil sample was collected from each of the 7 completed soil borings from Parcel #61. Typically, if impacted soil is identified, then additional soil samples are obtained; however, at Parcel #61 PID readings did not warrant any additional soil samples. Analyses of soil sample P61-SB-1 at the 4 to 5 foot interval did indicate a value of 12 for DRO which slightly exceeds the NC Action Level of 10. Sample P61-SB-1 did not indicate a value greater than 10 for GRO. Results from the remaining soil samples P61-SB-2 through P61-SB-7) did not report DRO and GRO values above the NC Action Level. Analyses of soil samples for VOC's by EPA method 8260 did indicate one detection for each boring, that being Acetone. Laboratory contamination is expected to have been the cause since acetone was in every sample and was not an anticipated site contaminant. All other VOC constituents are Below Reporting Limits (BRL). Figure 3 shows the Site Map with Analytical Data.

Since the field investigation and the Laboratory analytical report did not indicate significant contamination, an estimation of contamination was not warranted.

Copies of the original laboratory report and chain-of-custody documentation are included as Appendix D.

5.0 CONCLUSIONS

The following conclusions are based upon AMEC's evaluation of field observations and laboratory analyses of samples collected from the Site on December 8, 2011.

- The property presently operates as a gas station with convenience store.
- NCDENR UST Registered Tanks Database identified the presence of three USTs at the Site. The UST locations are beyond the expanded ROW thus not in the area investigated.
- Seven soil samples were collected from the proposed expanded ROW and analyzed for TPH GRO and DRO.
- There was no field indication of impacted soil. Laboratory analyses of soil samples reported one DRO detection of 12mg/kg, which is considered isolated based on the data. No GRO detections were reported.

6.0 RECOMMENDATIONS

The proposed NCDOT design at this time has minimal impact intended for Parcel 61. NCDOT should remain cautious of intercepting contaminated soil during road construction activities, thus AMEC recommends the following potential action:

- Segregation with proper assessment and handling of potentially petroleum-impacted soil during roadway improvement construction operations.

GEOPHYSICAL SURVEY REPORT

January 4, 2011

Ms. Helen Corley, LG
AMEC Earth and Environmental of North Carolina, Inc.
101 W. Friendly Avenue, Suite 603
Greensboro, NC 27401

RE: State Project: U-2551
WBS Element: 34832.1.1
County: Burke
Description: Morganton – SR 1922 (Enola Road)/SR 1924 (Old NC 18) from SR 2026 (Arnold Drive) to NC 18 (South Sterling Street)

**Subject: Project 09210013.32 Report on Geophysical Surveys
Parcel 61, Burke County, North Carolina**

Dear Ms. Corley:

SCHNABEL ENGINEERING SOUTH, PC (Schnabel) is pleased to present this report on the geophysical surveys we conducted on the subject property. We understand this letter report will be included as an appendix in your report to the NCDOT. The report includes two 11x17 color figures and two 8.5x11 color figures.

INTRODUCTION

The work described in this report was conducted on December 1 and 2, 2010, by Schnabel under our 2009 contract with the NCDOT. The work was conducted over the accessible areas of the parcel as indicated by the NCDOT to support their environmental assessment of the subject property. Photographs of the parcel are included on Figure 1. The property is located on the northeast side of Enola Road and Old Shelby Road in Morganton, NC. The purpose of the geophysical surveys was to locate possible metal underground storage tanks (USTs) in the accessible areas of the right-of-way and/or easement.

The geophysical investigation consisted of electromagnetic (EM) induction surveys using a Geonics EM61-MK2 instrument. The EM61 metal detector is used to locate metal objects buried up to about eight feet below ground surface. Ground-penetrating radar (GPR) investigations of selected EM61 anomalies, including areas of reinforced concrete, were conducted using a Geophysical Survey Systems SIR-3000 system equipped with a 400 MHz antenna. Photographs of the equipment used are shown on Figure 2.

FIELD METHODOLOGY

Locations of geophysical data points were obtained using a sub-meter Trimble Pro-XRS DGPS system. References to direction and location in this report are based on the US State Plane 1983 System, North Carolina 3200 Zone, using the NAD 83 datum, with units in US survey feet. The locations of existing site features (monitoring wells, signs, etc.) were recorded for later correlation with the geophysical data and for location references to the NCDOT drawings.

The EM61 data were collected along parallel survey lines spaced approximately 2.5 feet apart. The EM61 and DGPS data were recorded digitally using a field computer and later transferred to a desktop computer for data processing. The GPR data were collected along survey lines spaced one to two feet apart in orthogonal directions over areas of reinforced concrete and anomalous EM readings not attributed to cultural features. The GPR data were reviewed in the field to evaluate the possible presence of USTs. The GPR data also were recorded digitally and later transferred to a desktop computer for further review.

DISCUSSION OF RESULTS

The contoured EM61 data collected over Parcel 61 are shown on Figures 3 and 4. The EM61 early time gate results are plotted on Figure 3. The early time gate data provide the more sensitive detection of metal objects. Figure 4 shows the difference between the response of the top and bottom coils of the EM61 instrument (differential response). The difference is taken to remove the effect of surface and very shallowly buried metallic objects. Typically, the differential response emphasizes anomalies from deeper and larger objects such as USTs.

The early time gate and differential results show anomalies apparently caused by reinforced concrete, buried utilities, or known site features (Figures 3 and 4). The GPR data collected at the site do not indicate the presence of metallic USTs within the areas surveyed.

CONCLUSIONS

Our evaluation of the geophysical data collected on the subject property on Project U-2551 in Morganton, NC indicates the following:

The geophysical data do not indicate the presence of metallic USTs in the areas surveyed on the subject property.

LIMITATIONS

These services have been performed and this report prepared for AMEC Earth and Environmental of North Carolina, Inc. and the North Carolina Department of Transportation in accordance with generally accepted guidelines for conducting geophysical surveys. It is generally recognized that the results of geophysical surveys are non-unique and may not represent actual subsurface conditions.

We appreciate the opportunity to have provided these services. Please call if you need additional information or have any questions.

Sincerely,

SCHNABEL ENGINEERING SOUTH, PC

Data Qualifiers Key Reference:

- A Surrogate recovery above the control limit. There were no detection of GRO in the sample. No further action was taken.
- J Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
- SR Surrogate recovery outside the QC limits.
- BRL Below Reporting Limit
- MDL Method Detection Limit
- RPD Relative Percent Difference
- * Results reported to the reporting limit. All other results are reported to the MDL with values between MDL and reporting limit indicated with a J.

This report should not be reproduced, except in its entirety, without the written consent of Prism Laboratories, Inc.
