ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FEET
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	> 4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.
EXTREMELY INDURATED	SHARP HAMMER BLOWS REQUIRED TO BREAK SAMPLE; SAMPLE BREAKS ACROSS GRAINS.

DESCRIPTION: Caldwell Park Drive Extension Grade Separation

SUBJECT: Roadway Subsurface Investigation – Inventory Report

Project Description

S&ME, Inc. has completed he authorized roadway inventory report for the above referenced project. This report was performed in accordance with our Subconsultant Agreement for Professional Services between Simpson Engineers & Associates and S&ME, Inc. dated September 16, 2011 and the terms and conditions stated within. This project is located southwest of Harrisburg, North Carolina in Mecklenburg and Cabarrus County. The proposed project consists of extending Caldwell Park Drive, on new location, from Chochrane farm property to existing Caldwell Park Drive. The roadway will consist of a two lane roadway with curb and gutter. A new bridge will be constructed along the new Caldwell Park Drive alignment between (Stations 65+00 to 66+85 -L-) over Back Creek.

A geotechnical investigation was conducted between January 31, 2012 and February 9, 2012 by performing soil test borings. Drilling consisted of advancing 3-1/4 inch diameter hollow stem augers with standard penetration testing by a Diedrich D-50 drill rig mounted on an all-terrain carrier. The Diedrich D-50 drill rig is equipped with an automatic hammer. The roadway was investigated with thirty-three (33) soil test borings (B-1 through B-27, B-21A, B-23A and B-27A -L-) and (B-28 through B-30 -Y1-) including borings EB1-B, B1-B and EB2-B at the proposed bridge location. The borings were advanced to depths ranging from about 6.0 to 35.0 feet (elevations 675.4 to 598.4 feet) at collar elevations ranging from about 685.4 to 606.4 feet. Representative split-spoon soil samples were collected for visual classification and selected soil samples were submitted for laboratory analysis. Laboratory testing was performed in accordance with the AASHTO Soil Classification System.

The following survey lines were investigated.

Line	Station
-L-	9+62.43 to 75+30
-Y1-	10+00 to 17+00

Areas of Special Geotechnical Interest

1) Highly Plastic Soils: Areas were identified that contain soils that have plasticity indices of 35 or higher within the upper 2 feet of proposed grade within the following locations:

Line	Station
-L-	15+00 to 19+00
-L-	21+50 to 24+00
-L-	31+50 to 34+00
-L-	60+85 to 61+50
-L-	72+50 to 75+30

2) Crystalline Rock: Crystalline rock was encountered at or near proposed roadway grades within the following locations:

Line	Station
-L-	29+00 to 29+40
-L-	60+00 to 60+70

3) Alluvial Soils : The following areas contain relatively soft or wet soils which have the potential for subgrade problems during construction. In addition, these soils may contain cohesive soils or organic materials which may cause embankment instability or long term settlement problems.

Line	Station
-L-	40+90 to 44+90
-L-	48+50 to 49+25
-L-	63+50 to 66+85

4) Artificial Fill: Poorly compacted artificial fill exist above existing underground utilities including unpaved roadways, sewer easements and in areas where previous grading has occurred. Artificial fill material was encountered at the following locations:

Line	Station
-L-	60+85 to 61+50
-Y1-	69+75 to 75+30

Physiography and Geology

The site is located within the Western Piedmont Physiographic and Geologic Province of North Carolina. The Piedmont Province is characterized by gently to steeply sloping topography with well-rounded hills and along rolling ridges with a northeast-southwest trend dissected by a moderate to well developed (mature) dendritic-type drainage system consisting of drainage swales, hollows, tributaries, streams and rivers.

More specifically, the site is located within the Charlotte Belt. Based on previous mapping (N.C. Geologic Map 1985) and our knowledge of the local geology, the parent rock is interpreted to be felsic metavolcanic rock. These rocks typically weather irregular with shallow to deep residual soils overlying saprolite to bedrock.

Soil Properties

Soils present on this project are separated into three major categories based on origin. These categories include artificial fill, alluvial and residual soils.

Artificial fill materials were found in association with previous construction, utility easements and unpaved roadways in borings B-23, B-26, B-27 and B-27A.The depth of the fill materials ranged from about 2 to 9.5 feet. The fill materials encountered consist of soft to medium stiff red-brown and tan-orange highly plastic fine sandy silty clay (A-7-5, A-7-6). The standard penetration test (SPT) N-values in these soils ranged from 3 to 13 blows per foot (bpf). These soils appeared to be moist.

Alluvial deposits were encountered at the ground surface within drainage features (B-13, B-14 and B-17), and within the Back Creek flood plain (EB1-B, B1-B and EB2-B) to depths ranging from about 3 to 7 feet beneath the ground surface. Typically, alluvial deposits encountered consist of medium dense brown, clayey fine to coarse sand (A-2-4) and soft to medium stiff red-brown and brown fine to coarse sandy silty clay (A-7-5 and A-6) and slightly clayey fine to coarse sandy silt (A-4). N-values for the alluvial soils encountered ranged from 1 to 18 bpf.

Residual soils were encountered at the ground surface in borings B-1 through B-12, B-15, B-16, B-18 through B-23A, B-24, B-25 and B-28, B-29, B-30, and beneath the artificial fill and alluvium in the remaining borings. The residual soils consist of medium stiff to hard tan, brown and green-gray fine sandy silt (A-4), medium stiff to hard red-orange, orange-tan low to highly plastic coarse to fine sandy silty clay (A-6, A-7-5) and dense tan-white silty fine to coarse sand (A-2-4). The SPT N-values for the residual soils ranged from 6 to 78 bpf. The residual soils transition to weathered rock in borings B-7, B-8, B-9, B-15, B-18, B-19, B-21, B-22, B-23A, B-24, EB1-B, B1-B, B-28, B-29, B-30 at depths ranging from about 3 to 18.5 feet (elevations 675.6 to 599.4 feet) and extend to the depth of boring termination. Borings B-19 and B-32 encountered 3.5 to 4.5 feet thick ledges of weathered rock within the highly weathered residual soils. N-values in the weathered rock exceed 100 blows per foot.

Auger refusal material on crystalline rock (Metavolcanic) was encountered in borings B-7, B-23A, B-24, EB1-B, B1-B, EB2-B and B-29 at depths of approximately 5 to 22.6 feet (elevations of 672.5 to 605.8 feet) beneath the ground surface.

Groundwater

Groundwater was encountered only in the borings located adjacent to drainage features and the Back Creek flood plain (B-17 and B1-B). Water levels at these locations were measured at depths of about 1 and 6.5 feet (elevations 639.0 to 599.9 feet) beneath the ground surface. The elevation of the Back Creek at the time of our investigation was at about elevation 601.9 feet. In the higher elevation portions of the site, groundwater generally occurs greater than 10 feet below proposed grades. The potential for perched water levels is likely in most of the upland areas where stiff to hard relatively impermeable clays and silts exist as the surface.

Geotechnical Descriptive Analysis

For descriptive purposes, the project has been divided into three segments. The division of the alignments into three segments is based on the near surface and subsurface materials.

<u>Segment I</u>

-L-	9+62.43 to 40+90
-L-	44+90 to 48+50
-L-	49+25 to 52+50
-L-	60+75 to 63+50
-L-	66+80 to 75+30
-Y1-	10+00 to 17+00

Segment I consists of areas near grade or requiring fill above residual soils and cut sections along the alignment which will require excavations of about 8 to 10 feet of residual soils to reach design grades. The majority of this section consists of residual soils as described in the Soil Properties section of this report. These sections consist of extending the existing roadway along the alignments with typical construction methods. Segment I makes up approximately 80 percent of the investigated alignment.

<u>Segment II</u>

-L-	40+90 to 44+90
-L-	48+50 to 49+25
-L-	63+50 to 64+85

Segment II consists of areas requiring 10 to 20 feet of embankment fill above soft alluvial soils. Approximately 8 percent of the investigation falls within Section II.

Segment III

-L- 52+50 to 60+75

Segment III consists of areas requiring excavation depths of 10 to 25 feet in very stiff to hard residual soils and weathered rock materials. Approximately 12 percent of the investigation falls within Section III.
