ROCK DESCRIPTION		TERMS AND DEFINITIONS	
<p>HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL. STATE PROJECT: 39971.1.1 (B-4945)  
COUNTY: Vance  
DESCRIPTION: Bridge No. 36 on -L- (SR 1374) over Kerr Lake  
SUBJECT: Geotechnical Report – Inventory

The Geotechnical Engineering Unit has completed a subsurface investigation for this project and presents the following inventory. No plans, profiles, or cross-sections will be submitted for this roadway project.

**Project Description**

The project consists of the replacement of Bridge No. 36 on SR 1374 (Anderson Creek Rd.) over Kerr Lake. The total length of the roadway portion of the project is 0.10 miles. The proposed grade will be raised just slightly compared to the existing grade. Three hand auger borings were performed in June 2015 along with a review of nearby projects. Representative soil samples were collected for visual classification in the field.

**Physiography & Geology**

The project is located 4.0 miles northwest of the town of Middleburg in the gently rolling terrain of the Piedmont Physiographic province. A mixture of woods, farmland and some scattered single-family dwellings are located along the project corridor. Geologically the site is underlain by intrusive granitic rock from the Raleigh belt.

**Soil Properties**

Soils within the project are roadway embankment, alluvial, and residual soils. The soils consist of granular and cohesive materials.

Roadway embankment soils consist of orange, tan, and brown, very soft to stiff, silty and sandy clay (A-7-6 and A-6) with some loose, silty sand (A-2-4). This material varies in depth from 2.0 to 8.0 feet. Alluvial soils consist primarily of tan, brown, and gray, very loose to medium dense, moist to saturated, silty and coarse sand (A-2-4 and A-1-b) with some gravel and cobbles. Residual soils consist of gray, tan, brown, and white, loose to medium dense, moist, silty and clayey sand (A-2-4, and A-2-6) and some medium stiff to stiff, sandy silt (A-4).

**Rock Properties**

Weathered and crystalline rock occur at depths greater than 30.0 feet below the ground surface and consist of gray and white, severely weathered to fresh, hard, granite. Crystalline rock is not anticipated to cause problems during construction.

**Groundwater**

The groundwater level is anticipated to be at elevations similar to Kerr Lake. Seasonal fluctuations in the water table can be expected. Groundwater is not anticipated to cause problems during construction.
