1.0 INTRODUCTION

Mid-Atlantic Associates, Inc. (Mid-Atlantic) has prepared this Preliminary Site Assessment (PSA) Report in response to the North Carolina Department of Transportation's (NCDOT) Request for Technical and Cost Proposal (RFP) dated July 30, 2018 and in accordance with Mid-Atlantic's "Revision No. 1 Technical and Cost Proposal for Preliminary Site Assessment" dated August 15, 2018. Mid-Atlantic has performed the PSA for the Malissa B. Sauls property (Subject Site), located at 1001 N. Berkeley Boulevard in Goldsboro, North Carolina (**Drawing 1.1**). The Subject Site is one of four parcels being assessed in association with this project. Acquisition of the right-of-way/easement is necessary for roadway improvements along this project. The Subject Site is currently occupied by Scott's Automotive repair service. Two masonry buildings are located on the site.

The NCDOT contracted with Mid-Atlantic to perform the PSA due to the possible historical use of petroleum or other regulated substances on the site. The PSA was performed to determine if relict UST systems may exist and/or if the soils and/or groundwater have been impacted as a result of the historical use of the Subject Site.

This report documents the results of the geophysical survey, the locations and volume of any USTs identified in the investigation area, and the subsurface investigation of identified areas of concern conducted at the site. The opinions included herein are based on our experience and information obtained during the study. This report is based on limited observations made on the dates noted using procedures described herein. If additional information becomes available, we request the opportunity to review the information, reassess the potential environmental concerns, and modify our conclusions, if appropriate.

1.1 Site Description

The Subject Site is located in a commercial area of Goldsboro. It is currently developed with two buildings that are used by Scott's Automotive, a vehicle repair business. The site is bounded to the northeast by a commercial strip mall, to the southeast (across N. Berkeley Blvd.) by commercial enterprises, and to the west by Highway 70 and its east-bound on-ramp. Please refer to **Drawing 1.1** for the site location and site topography.

1.2 Scope of Work

Per the NCDOT RFP, the scope of work for this PSA is as follows:

- Notify property owner/tenant of proposed work scope.
- Locate all USTs and determine approximate size and contents (if any).
- Determine if contaminated soils are present.
- Test soil for contaminants relevant to the site's past use and/or possible release(s) using UVF methodology.

- Include the RedLab graphs in reports in the report and send the GeoEnvironmental Section a copy of the RedLab Excel file(s).
- If contamination is evident and groundwater is encountered, convert one boring into a temporary well and collect a groundwater sample.
- If contamination is evident, estimate the quantity of impacted soils and indicate the approximate area of soil contamination on a site map.
- Provide a MicroStation file with the location of soil borings, USTs, soil contamination and monitoring wells.
- Prepare a report including field activities, findings, and recommendations for the site.

2.0 SITE HISTORY

2.1 Parcel Usage

Based on historical aerial photography, the Subject Site appears to be used for agricultural purposes in 1959. Two structures that appear to be part of the present-day structures are present on the property in 1967, and the 1978 photo shows that these structures have been added onto and are in their current configuration. No obvious evidence of petroleum sales (pump islands or canopies) are visible. Historical aerial photographs from NCDOT and Google Earth are included as **Appendix A**.

2.2 Facility ID Numbers

No registered USTs are associated with the property address.

2.3 Groundwater Incident Numbers

No groundwater incidents are associated with the property address.

3.0 SITE OBSERVATIONS

3.1 Groundwater Monitoring Wells

Mid-Atlantic observed one former groundwater monitoring well (RMW-1) on the Subject Site. The location of the well is shown on **Drawing 3.1**. Mid-Atlantic's technician opened the well cover and discovered that the well is four inches in diameter, PVC and had an approximate 1.5-inch diameter horizontal PVC pipe connected to the casing, suggesting it may have been used for remedial purposes in the past (photo in **Appendix A**). The well identification tag labeled the well as 15 feet deep. The well has not been abandoned and the manhole and pad is still intact. A report for the former groundwater incident at Parcel No. 24 (Delmus Bridgers/Cash Farm Supplies, Incident No.6695) did not make reference to this well, but it is assumed that the well is

associated with this release, since no groundwater incidents were reported with respect to Parcel 22. The report did reference a monitoring well MW-6 on Parcel 22, but this well could not be located during site reconnaissance activities conducted on August 22, 2018. A copy of the report, which includes a site map showing the locations of the monitoring wells constructed in association with Incident No. 6695, is provided in **Appendix B**.

3.2 Active USTs

No "Active" USTs were identified on site during our reconnaissance.

3.3 Features Apparent Beyond ROW/Easement

No suspect features (i.e. monitoring wells, remediation systems, hydraulic lifts) were observed by Mid-Atlantic during the completion of this PSA. Two buildings on site have in-ground reservoir hydraulic lifts. According to the business owner, these lifts are present in the masonry building closest to the road as well as one of the buildings further to the north.

4.0 METHODS

The PSA field activities included a geophysical survey of the proposed right-of-way and temporary construction easement areas to help identify potential underground storage tanks or other subsurface anomalies that may require further investigation. Based on the results of the survey and historical information, soil and groundwater samples were collected to help identify contaminated soils and/or groundwater that may affect future roadbuilding or utility construction activities. These activities are outlined below. Field work was conducted under a Health and Safety Plan prepared by Mid-Atlantic Associates.

4.1 Geophysics

A geophysical survey of the area of concern on the Subject Site was conducted by Pyramid Geophysical Services (Pyramid) from August 22 and 23, 2018. The Geophysical survey was completed to locate subsurface utilities and buried objects such as USTs, private utilities, etc. Sub-surface utilities and buried objects were scanned using a combination of electromagnetic (EM) and ground penetrating radar (GPR) methods. A description of the geophysical survey methods used at the Subject Site are included in Pyramid's "Geophysical Survey, Metallic UST Investigation: Parcel 22, NCDOT Project U-5724" dated September 6, 2018 and included in **Appendix C.** In addition, the area of the geophysical survey is shown in the drawings provided in Pyramid's report.

4.2 Borings and Temporary Well Installation

Before fieldwork was initiated, North Carolina 811 was contacted to mark public utility service lines. Following utility location, Mid-Atlantic completed assessment activities on September 24 and 25, 2018 [Note: Mid-Atlantic's field work was delayed approximately one week due to Hurricane Florence]. The activities included collection of soil samples from the borings and installation of one temporary monitoring well in the event that evidence of contamination was encountered in the soil. The drilling and temporary well construction services were performed by Quantex, Inc. of Raleigh, North Carolina and Mid-Atlantic's technician provided oversight. Boring locations were placed on the Subject Site in areas of the right of way and construction easement. Sampling locations were evenly spaced within these areas since the geophysical survey did not reveal a UST or other data requiring specific focus.

4.2.1 Soil Sampling Activities

On September 24, 2018, Mid-Atlantic mobilized to the site to oversee the advancement of four soil borings on the parcel. The work was completed during the same mobilization as sampling conducted for Parcels 5, 22, and 24. Sampling locations are shown on **Drawing 3.1**.

Using a GeoProbe "macrocore" sampling device and direct push technology (DPT), continuous soil samples were collected at each soil boring and scanned for the presence of volatile organic compounds (VOCs) using a RKI GX6000 Photo-Ionization Detector (PID). The borings were advanced to a depth of approximately 10 feet BLS (note: the water table was typically found in the 3 to 4 ft BLS range). The soils were classified for soil type and screened at approximate two-foot intervals using the PID. Boring Logs **(Appendix D)** note the PID readings and soil type descriptions recorded by Mid-Atlantic personnel as drilling progressed. In general, the soils at the site consisted of light to dark brown to tan clayey to silty fine to medium sands.

Upon completion of the borings (and completion of the borings at the other three parcels), Mid-Atlantic collected GPS coordinates on September 26, 2018 for the sampling locations using a Trimble Geo 7X unit. The coordinates were used to place the final locations of the sample points on the provided drawings.

4.2.2 Groundwater Sampling Activities

One temporary monitoring well (TMW-22-2) was installed in boring the SB-22-2 location, which exhibited elevated PID readings and a strong petroleum odor. The temporary well was constructed as follows:

- The boring was advanced using the Geoprobe's macrocore sampler through the saturated zone to a depth of 12 feet BLS (water table at 3.6 feet BLS);

- A one-inch diameter, Schedule 40 PVC well was installed with 10 feet of 0.010-inch slotted screen (screened 2 to 12) and was fitted with a threaded bottom cap and threaded riser to approximately six inches above land surface;
- A sand pack was installed from bottom of well to just above the top of the screened interval; and
- The well was developed by purging with a bailer to remove fine particles.

Upon completion of the well construction and sample collection, the well was abandoned by pulling the casing from the ground and filling the hole with soil cuttings.

4.2.3 Sample Protocol

A total of four soil samples were collected for laboratory analysis in accordance with the Mid-Atlantic procedures located in **Appendix E.** Samples were collected into sampling containers provided by the laboratory, packed into an ice-filled cooler and shipped to Rapid Environmental Diagnostics Laboratories, LLC (RED Lab) in Wilmington, North Carolina. The soil samples were analyzed for total petroleum hydrocarbons (TPH GRO and DRO) and other constituents using the ultraviolet fluorescence (UVF) detector method.

Additionally, a groundwater sample was collected from well TMW-22-2 using the methods described in **Appendix E**. The sample was shipped to Pace Analytical Laboratories in Mt. Juliet, Tennessee, where they were analyzed for VOCs using Standard Method 6200B and SVOCs using EPA Method 625.

5.0 RESULTS

5.1 Objects

5.1.1 Underground Storage Tanks

As shown in **Appendix C**, the geophysical survey did find evidence characteristic of buried metallic debris but did not find evidence of USTs existing within the area of the survey.

5.1.2 Hydraulic Lifts

No Hydraulic lifts were identified in the survey area during Mid-Atlantic's completion of this PSA.

5.1.3 Monitoring Wells

Mid-Atlantic observed one former groundwater monitoring well (RMW-1) on the Subject Site. The location of the well is shown on **Drawing 3.1**. The well is four inches in diameter and 15 feet deep. The well has not been abandoned and the manhole and pad is still intact. A report for the former groundwater incident at Parcel No. 24 (Delmus Bridgers/Cash Farm Supplies, Incident No.6695) referenced a monitoring well MW-6 on Parcel 22, but this well could not be located during site reconnaissance activities. See Section 3.1 for further information.

5.1.4 Oil-Water Separators

No Oil-Water Separators (OWS) were identified during Mid-Atlantic's completion of this PSA.

5.2 Impacted Media

Impacts to soil and groundwater, including the depths and volume calculations (if applicable), are discussed below.

5.2.1 Impacted Soil &/or Water & Groundwater

As documented in RED Lab's report located in **Appendix F** and summarized (along with PID readings) in **Table 5.1**, TPH GRO were detected in two of the four samples at concentrations exceeding the UVF analyzer's detection limit. However, none of the samples exhibited concentrations exceeding the NCDEQ Action Level of 50 mg/kg. TPH DRO were detected in all four samples at concentrations exceeding the UVF analyzer's detection limit. However, none of the samples exhibited concentrations exceeding the NCDEQ Action Level of 100 mg/kg. The laboratory analytical report and graphs for the soil samples collected at the site are provided in **Appendix F**. Detected chemical constituents in soil samples are shown on **Drawing 3.1.**

An assessment of water (surface water) was not included in this scope of work. Surface water was not observed on site.

A laboratory report for the groundwater sample collected from temporary monitoring well TMW-22-2 is provided in **Appendix G** summarized in **Table 5.2,** and the results are shown on **Drawing 5.1**. As summarized, petroleum fuel-related constituents were detected at concentrations exceeding the NCGQS. The more volatile constituents (e.g., benzene) are not present in the sample and the constituents detected in the sample are more representative of an older plume that has degraded over time. The impacted groundwater is likely related to the historical incident No. 6695 that occurred on adjacent Parcel No. 24 and was later closed by NCDEQ.

5.2.2 Depth

As documented in the soil boring logs and laboratory analytical reports, impacted soil above regulatory action limits was not encountered in the unsaturated zone in borings placed on the site. The depth to water in the borings ranged from approximately 3.4 feet to approximately 3.9 feet BLS. The water table may be higher than normal due to Hurricane Florence recently passing through.

It appears that the shallow groundwater has been impacted by the historical UST release at adjacent Parcel No. 24. Given the depth to groundwater (generally in the 3 to 4 feet BLS range, and with the potential for variance due to natural fluctuation), it is possible that impacted groundwater may be encountered during the construction of drainage or other utilities.

5.2.3 Quantities Calculation

During the advancement of the soil borings completed for this PSA, petroleum-impacted soil was not encountered at concentrations exceeding NCDEQ's Action Levels for TPH. However, given the shallow water table and the excavation required for drainage or other utility installations, it is possible that relatively small quantities of petroleum-contaminated waste (soils and/or groundwater) could be generated during road improvement activities.

6.0 CONCLUSIONS

6.1 Interpretation of Results

Based on the results of this assessment, Mid-Atlantic concludes the following:

- A historical release of petroleum that occurred on adjacent Parcel No. 24 has impacted the groundwater beneath the site. Based on the depth to groundwater (approximately 3 to 4 feet BLS, with potential for natural fluctuations), it is possible that impacted soil and/or groundwater could be encountered during drainage utility and/or other construction activities.

6.2 Geophysics

Based on the results of the Geophysical assessment, Mid-Atlantic concludes the following:

- The geophysical survey did find evidence characteristic of buried metallic debris but did not find evidence of USTs existing within the area of the survey.

6.3 Sampling

Based on the results of the sampling, Mid-Atlantic concludes the following:

- Based on the four soil borings advanced at the site, vadose zone contamination was not encountered but small quantities of soil waste could be generated if soils in the saturated zone are excavated for utility installation;

- Petroleum-impacted groundwater exceeding the NCGQS was encountered in a temporary well installed at location TMW-22-2. This contamination is likely the result of the historical UST system release on the adjacent Parcel No. 24 site.

6.4 Groundwater

- The depth to groundwater at the site ranges from 3.4 to 3.9 feet BLS. Based on the depth to groundwater, the proposed construction plans for grading and drainage, and the sampling results, it is possible that impacted groundwater could be encountered during road improvement activities.

6.5 Quantities

- During the advancement of the soil borings completed for this PSA, petroleum-impacted soil was not encountered at concentrations exceeding NCDEQ's Action Levels for TPH. However, given the shallow water table and the excavation required for drainage or other utility installations, it is possible that relatively small quantities of petroleum-contaminated waste (soils and/or groundwater) could be generated during road improvement activities.

7.0 RECOMMENDATIONS

Based on these results, Mid-Atlantic recommends the following:

- If encountered during drainage or other utility installation, residual soil contamination should be properly managed and disposed; and

- Since impacted groundwater is present at a relatively shallow depth (3 to 4 ft BLS range, with variations due to natural fluctuation), it is possible that it could be encountered during drainage utility construction or operation. Mid-Atlantic recommends constructing a sealed drainage system to prevent potentially impacted water from entering the pipes. If groundwater is encountered during construction, it should be containerized and properly managed and disposed.

Subject: Cash Farm Supply/Delmus Hardware

Scott,

Just thought I would update you on the status of the Monitoring Report. I'm waiting on Paul, Delmus's son to find evidence of the last time they used the tanks so I can finish the eligibility form. As I mentioned before, the hardware store caught fire several years ago and burnt up all their files.

MONITORING REPORT

CASH FARM SUPPLIES/DELMUS BRIDGER'S SITE
1003 NORTH BERKELEY BLVD., WAYNE COUNTY, NC
INCIDENT NUMBER: 6695
RISK CLASSIFICATION: INTERMEDIATE
RANKING: I 140-D

DATE OF REPORT
19 JULY 2013

I. INTRODUCTION

A. ***Site Location****. Cash Farm Supplies (Delmus Hardware) is located at the southwest corner of Highway 70 West and Highway 581, Goldsboro, NC. A location map showing the site location can be seen in Appendix A, Enclosure 1.*

B. Underground Storage Tanks. *Two (2) 10,000-gallon underground storage tanks (UST) used to store gasoline were installed in June 1969. On 26 April 1991 during a tank closure, groundwater samples were collected for laboratory analysis. Lab results on the collected water samples were sent to the Division of Environmental Management (DEM) in Washington. On 31 May 1991 Delmus Bridgers was issued a Notice Of Violation(NOV) from the DEM and was requested to conduct a Comprehensive Site Assessment (CSA). The CSA was completed and a report, dated 14 January 1992 was submitted to the DEM. The site was recently issued a NORR dated 1 May 2012 requesting a Groundwater Monitoring Report be conducted.*

II. GROUNDWATER SAMPLING RESULTS

A. ***Summary of Current Groundwater Sampling Results.*** *A total of ten (10) monitoring wells were sampled from wells sampled for previous groundwater investigations. These wells are identified as MW-11A, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, & MW-10. Three of the wells, MW-7, MW-8, & MW-9 had been destroyed from construction activity which had taken place over the years so only seven (7) of the ten (10) wells were sampled. A map showing the well locations can be seen in Appendix A, Enclosure 2. Laboratory results can be seen in Appendix B. A table summarizing these results is shown below:*

Date Sampled	*Sample Location*	*Parameter Exceeding 2L Standard*	*Concentration ug/l*	*2L Standard ug/l*	*Laboratory Method*
6/26/2013	*MW-11A*		*ND*		*8260B*
6/26/2013	*MW-2*		*ND*		*8260B*
6/26/2013	*MW-3*		*ND*		*8260B*
6/26/2013	*MW-4*		*ND*		*8260B*
6/26/2013	*MW-5*		*ND*		*8260B*
6/26/2013	*MW-6*	*Benzene*	*8.1*	*1.0*	*8260B*
		Ethylbenzene	*450*	*600*	
		Toluene	*23*	*600*	
		Xylenes	*690*	*500*	
6/26/2013	*MW-7*		*NS*		
6/26/2013	*MW-8*		*NS*		
6/26/2013	*MW-9*		*NS*		
6/26/2013	*MW-10*		*ND*		*8260B*

Note:

ug/l = part per billion

ND = No parameters detected

NS = Not sampled due to well being destroyed

8.1 = Highlighted numbers exceed 15A NCAC 02L .0202 groundwater standards

III. CONCLUSIONS/SUMMARY

A. Ten monitoring wells were selected for groundwater collection. Three of the wells had been destroyed so only seven of the existing wells were sampled. Out of the seven wells sampled, only one well, MW-6, had parameters detected by the laboratory using Method 8260B. This well had two parameters detected which exceeded the 15A NCAC 02L .0202 groundwater standard. These were Benzene and total Xylenes.

EXECUTIVE SUMMARY

Project Description: Pyramid Environmental conducted a geophysical investigation for Mid-Atlantic Associates, Inc. at Parcel 22, located at 1001 North Berkeley Boulevard, in Goldsboro, NC. The survey was part of a North Carolina Department of Transportation (NCDOT) Right-of-Way (ROW) investigation (NCDOT Project U-5724). The survey was designed to extend from the existing edge of pavement into the proposed ROW and/or easements, whichever distance was greater. Conducted from August 22-23, 2018, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

Geophysical Results: The geophysical investigation consisted of electromagnetic (EM) induction-metal detection and ground penetrating radar (GPR) surveys. A total of eight EM anomalies were identified. The majority of the EM anomalies were directly attributed to visible cultural features. Two EM anomalies were associated with suspected buried metallic debris and were further investigated with GPR. GPR recorded evidence of isolated high-amplitude reflectors at the location of one of the EM anomalies that is characteristic of buried metallic debris. GPR did not record any evidence of significant buried structures at the second unknown EM anomaly location. Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 22.

INTRODUCTION

Pyramid Environmental conducted a geophysical investigation for Mid-Atlantic Associates, Inc. at Parcel 22, located at 1001 North Berkeley Boulevard, in Goldsboro, NC. The survey was part of a North Carolina Department of Transportation (NCDOT) Right-of-Way (ROW) investigation (NCDOT Project U-5724). The survey was designed to extend from the existing edge of pavement into the proposed ROW and/or easements, whichever distance was greater. Conducted from August 22-23, 2018, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

The site included one former and one active service garage in a shopping plaza surrounded by grass, asphalt, and gravel surfaces. An aerial photograph showing the survey area boundaries and ground-level photographs are shown in **Figure 1**.

FIELD METHODOLOGY

The geophysical investigation consisted of electromagnetic (EM) induction-metal detection and ground penetrating radar (GPR) surveys. Pyramid collected the EM data using a Geonics EM61-MK2 (EM61) metal detector integrated with a Geode External GPS/GLONASS receiver. The integrated GPS system allows the location of the instrument to be recorded in real-time during data collection, resulting in an EM data set that is geo-referenced and can be overlain on aerial photographs and CADD drawings. A boundary grid was established around the perimeter of the site with marks every 10 feet to maintain orientation of the instrument throughout the survey and assure complete coverage of the area.

According to the instrument specifications, the EM61 can detect a metal drum down to a maximum depth of approximately 8 feet. Smaller objects (1-foot or less in size) can be detected to a maximum depth of 4 to 5 feet. The EM61 data were digitally collected at approximately 0.8-foot intervals along north-south trending or east-west trending,

generally parallel survey lines, spaced five feet apart. The data were downloaded to a computer and reviewed in the field and office using the Geonics NAV61 and Surfer for Windows Version 15.0 software programs.

GPR data were acquired across select EM anomalies on August 23, 2018, using a Geophysical Survey Systems, Inc. (GSSI) UtilityScan DF unit equipped with a dual frequency 300/800 MHz antenna. Data were collected both in reconnaissance fashion as well as along formal transect lines across EM features. The GPR data were viewed in real-time using a vertical scan of 512 samples, at a rate of 48 scans per second. GPR data were viewed down to a maximum depth of approximately 6 feet, based on dielectric constants calculated by the DF unit in the field during the reconnaissance scans. GPR transects across specific anomalies were saved to the hard drive of the DF unit for post-processing and figure generation.

Pyramid's classifications of USTs for the purposes of this report are based directly on the geophysical UST ratings provided by the NCDOT. These ratings are as follows:

Geophysical Surveys for Underground Storage Tanks
on NCDOT Projects

High Confidence	Intermediate Confidence	Low Confidence	No Confidence
Known UST Active tank - spatial location, orientation, and approximate depth determined by geophysics.	**Probable UST** Sufficient geophysical data from both magnetic and radar surveys that is characteristic of a tank. Interpretation may be supported by physical evidence such as fill/vent pipe, metal cover plate, asphalt/concrete patch, etc.	**Possible UST** Sufficient geophysical data from either magnetic or radar surveys that is characteristic of a tank. Additional data is not sufficient enough to confirm or deny the presence of a UST.	Anomaly noted but not characteristic of a UST. Should be noted in the text and may be called out in the figures at the geophysicist's discretion.

DISCUSSION OF RESULTS

Discussion of EM Results

A contour plot of the EM61 results obtained across the survey area at the property is presented in **Figure 2**. Each EM anomaly is numbered for reference in the figure. The

following table presents the list of EM anomalies and the cause of the metallic response, if known:

LIST OF METALLIC ANOMALIES IDENTIFIED BY EM SURVEY

Metallic Anomaly #	Cause of Anomaly	Investigated with GPR
1	Suspected Debris	☑
2	Metal on Surface	
3	Fence Posts	
4	Metallic Debris/Fence Posts	☑
5	Hydrant/Fence Posts	
6	Manholes/Sign	
7	Suspected Utility	
8	Utilities/Sign	

The majority of the EM anomalies were directly attributed to visible cultural features at the ground surface, including surface metal, fence posts, a hydrant, manholes, and utilities. Anomaly 1 was associated with suspected debris and was further investigated with GPR. Anomaly 4 was associated with metallic debris and a fence post and was further investigated with GPR.

Discussion of GPR Results

Figure 3 presents the locations of the GPR transects performed at the property, as well as the transect images. A total of three GPR transects were recorded. Transect 1 was collected across EM Anomaly 4 and recorded small hyperbolic anomalies that are characteristic of buried metallic debris.

Transects 2 and 3 were collected across EM Anomaly 1. These transects did not record any evidence of significant structures.

Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 22. **Figure 4** provides an overlay of the geophysical survey onto the NCDOT MicroStation engineering plans for reference.

SUMMARY & CONCLUSIONS

Pyramid's evaluation of the EM61 and GPR data collected at Parcel 22 in Goldsboro, North Carolina, provides the following summary and conclusions:

- The EM61 and GPR surveys provided reliable results for the detection of metallic USTs within the accessible portions of the geophysical survey area.
- The majority of the EM anomalies were directly attributed to visible cultural features.
- Two EM anomalies were associated with suspected buried metallic debris and were further investigated with GPR.
- GPR recorded evidence of isolated high-amplitude reflectors at the location of one of the EM anomalies that is characteristic of buried metallic debris. GPR did not record any evidence of significant buried structures at the second unknown EM anomaly location.
- Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 22.

LIMITATIONS

Geophysical surveys have been performed and this report was prepared for Mid-Atlantic Associates, Inc. in accordance with generally accepted guidelines for EM61 and GPR surveys. It is generally recognized that the results of the EM61 and GPR surveys are non-unique and may not represent actual subsurface conditions. The EM61 and GPR results obtained for this project have not conclusively determined the definitive presence or absence of metallic USTs, but the evidence collected is sufficient to result in the conclusions made in this report. Additionally, it should be understood that areas containing extensive vegetation, reinforced concrete, or other restrictions to the accessibility of the geophysical instruments could not be fully investigated.

EM61 METAL DETECTION RESULTS

NO EVIDENCE OF UNKNOWN METALLIC USTs OBSERVED.

The contour plot shows the differential results of the EM61 instrument in millivolts (mV). The differential results focus on larger metallic objects such as USTs and drums. The EM61 data were collected on August 22, 2018, using a Geonics EM61 instrument. Verification GPR data were collected using a GSSI UtilityScan DF instrument with a dual frequency 300/800 MHz antenna on August 23, 2018.

MID-ATLANTIC FIELD PROCEDURES

Mid Atlantic
Engineering & Environmental Solutions

Soil Sampling Procedures

I. Sample Collection

Direct Push Technology (DPT, or "Geoprobe")

DPT uses a truck-mounted hydraulic rig to push a steel sampling probe into the subsurface to collect soil and/or groundwater samples. The sampling device used to collect the soil samples during this investigation was the "macrocore" sampler. This sampler consists of a four-foot long, two-inch diameter stainless steel spoon containing a clear, acetate liner. When the macrocore sampler is driven into the subsurface, the soil is collected into the acetate liner and then retrieved to the land surface. The liner is then cut open and the soil lithology is characterized and soil samples are collected.

Split Spoon Sampling

This method of soil sampling is typically used during advancement of hollowstem augers for the construction of monitoring wells. Soil samples are obtained from the borings by driving a prewashed, 1-3/8-inch inner-diameter split-spoon sampler at five foot intervals to termination in general accordance with ASTM D-1586 (Standard Penetration Test) specifications. Blow counts for each six inches of split-spoon penetration are recorded during advancement of the spoon. Samples are then retrieved to the land surface, the split-spoon is opened, and the soil lithology is characterized and soil samples are collected.

Hand Augering

This method is typically used for shallow sampling in areas where access is limited or underground obstacles such as utilities may be present. A pre-washed, three-inch diameter steel auger bucket is attached to extension rods and manually turned to penetrate the subsurface to the desired sampling depth. Samples are then retrieved to the land surface and the soil lithology is characterized and soil samples are collected directly from the hand auger bucket.

Excavator Bucket Sampling

This method is typically used during UST excavation and soil excavation projects. The soil samples are collected from the excavator bucket when it is not safe to collect the samples by other means. Care is taken when collecting samples from the bucket to avoid soil that has come in contact with the bucket itself to avoid cross contamination.

II. Headspace Field Screening

A portion of each sample is removed from the sampling device and placed in a pre-labeled, plastic "ziploc" bag. After several minutes, the gas contained in the "headspace" or void area within the bag is tested with a photoionization detection (PID) and/or Flame Ionization Detector (FID). These are useful as scanning devices to detect the presence of volatile organic compounds (VOCs) but are not relied upon to determine specific levels of contamination. Typically, the samples exhibiting the highest headspace readings will be submitted to the laboratory for analysis.

III. Preparation for Laboratory Analysis

The sample collector dons new nitrile sampling gloves prior to handling each sample. The samples are placed into laboratory-prepared, pre-labeled, sampling containers, packed in ice, and shipped to a certified laboratory under chain-of-custody control. The sampler places an executed custody seal on the cooler prior to leaving the sampler’s custody. Laboratory analyses to be performed on the samples, along with other sampling information, are specified on the chain-of-custody, which is placed in the cooler with the samples.

Groundwater Sampling Procedures

I. Sample Collection

A. Monitoring Wells

Prior to sample collection, each well is purged of three to five standing well volumes or to dryness to remove stagnant water from the well and well bore in an effort to collect samples that are representative of the water quality in the formation surrounding each well. Purging is performed either with a new, polyethylene bailer dedicated to each well, or with a decontaminated pump. Samples are retrieved from the monitoring well using the dedicated bailer. New nylon string is used on each dedicated bailer, and new nitrile sampling gloves are donned prior to purging and sampling of each well.

B. Geoprobe “Screen Point Sampler”

The screen point sampler is a “grab” sampling device that is driven into the saturated zone and a surrounding metal sheath is retracted, exposing a screen. Groundwater entering the screen is then drawn to land surface through disposable tubing that is placed through the hollow push rods. The sample is collected from the tubing into the appropriate sampling glassware.

C. Water-Supply Wells

Water samples are typically collected from the available spigot that is nearest to the well. The water is allowed to run at a high flow from the spigot for approximately 10 to 15 minutes to allow the water in the delivery lines to be purged. The sample flow is then reduced and the samples are collected directly into pre-labeled containers as described below. New nitrile sampling gloves are donned prior to sampling of each well.

D. Treatment System Influent/Effluent

Samples are typically collected from the influent or effluent of pump-and-treat groundwater remediation systems using designated sampling ports in the influent and effluent water transport lines. The water is typically allowed to run for several seconds to clear potential debris in the sampling port. The sample is then collected directly into sampling containers as described below. New nitrile sampling gloves are donned prior to sample collection.

II. Preparation for Laboratory Analysis

Groundwater samples are decanted directly into laboratory-prepared, pre-labeled, sampling containers, packed in ice, and shipped to a certified laboratory under chain-of-custody control. Laboratory analyses performed on the samples are specified on the chain-of-custody.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

1.0 INTRODUCTION

Mid-Atlantic Associates, Inc. (Mid-Atlantic) has prepared this Preliminary Site Assessment (PSA) Report in response to the North Carolina Department of Transportation's (NCDOT) Request for Technical and Cost Proposal (RFP) dated July 30, 2018 and in accordance with Mid-Atlantic's "Revision No. 1 Technical and Cost Proposal for Preliminary Site Assessment" dated August 15, 2018. Mid-Atlantic has performed the PSA for the Delmus Bridgers-Family Limited Partnership property (Subject Site), located at 1003 N. Berkeley Boulevard in Goldsboro, North Carolina (**Drawing 1.1**). The Subject Site is one of four parcels being assessed in association with this project. Acquisition of the right-of-way/easement is necessary for roadway improvements along this project. The Subject Site is currently a paved driveway and parking serving the adjacent shopping center. Ray's Auto repair service is located directly adjacent to and to the northwest of the property.

The NCDOT contracted with Mid-Atlantic to perform the PSA due to the possible historical use of petroleum or other regulated substances on the site. The PSA was performed to determine if relict UST systems may exist and/or if the soils and/or groundwater have been impacted as a result of the historical use of the Subject Site.

This report documents the results of the geophysical survey, the locations and volume of any USTs identified in the investigation area, and the subsurface investigation of identified areas of concern conducted at the site. The opinions included herein are based on our experience and information obtained during the study. This report is based on limited observations made on the dates noted using procedures described herein. If additional information becomes available, we request the opportunity to review the information, reassess the potential environmental concerns, and modify our conclusions, if appropriate.

1.1 Site Description

The Subject Site is located in a commercial area of Goldsboro. It is currently developed with an asphalt-paved driveway and parking area for an adjacent shopping center. Ray's Auto, a vehicle repair business, is located directly adjacent to and to the northwest of the parcel. The Subject Site is bounded to the northeast by a commercial strip mall, to the southeast (across N. Berkeley Blvd.) by commercial enterprises, and to the southwest by Scott's Automotive (Parcel No. 22). Please refer to **Drawing 1.1** for the site location and site topography.

1.2 Scope of Work

Per the NCDOT RFP, the scope of work for this PSA is as follows:

- Notify property owner/tenant of proposed work scope.
- Locate all USTs and determine approximate size and contents (if any).
- Determine if contaminated soils are present.

- Test soil for contaminants relevant to the site's past use and/or possible release(s) using UVF methodology.
- Include the RedLab graphs in reports in the report and send the GeoEnvironmental Section a copy of the RedLab Excel file(s).
- If contamination is evident and groundwater is encountered, convert one boring into a temporary well and collect a groundwater sample.
- If contamination is evident, estimate the quantity of impacted soils and indicate the approximate area of soil contamination on a site map.
- Provide a MicroStation file with the location of soil borings, USTs, soil contamination and monitoring wells.
- Prepare a report including field activities, findings, and recommendations for the site.

2.0 SITE HISTORY

2.1 Parcel Usage

Based on historical aerial photography, the Subject Site appears to be used for agricultural purposes in 1959 through at least 1967. The 1978 photo shows that several structures have been constructed on the property, including two that are no longer present. According to the "Comprehensive Site Assessment" (CSA) report (**Appendix A**) dated January 14, 1992, and prepared by Contractors and Engineers Services, Inc. (CES), two 10,000-gallon capacity gasoline USTs were installed at this site in June of 1969 and operated in conjunction with a service station until March of 1981, and were removed in August of 1989. Although no maps were provided in the copy of the report available, the report text stated that monitoring well MW-1 was located in the center of the former tank basin. However, the location of this well is not shown on the drawings in the reports readily available, which are included in **Appendix A**. Although it is not clearly visible, the 1980 aerial photo appears to show pump islands located to the southeast of the building and northwest of Berkeley Boulevard. The 1990 aerial photo shows that the building has been replaced by a larger building, apparently in its current configuration. Historical aerial photographs from NCDOT and Google Earth are included as **Appendix B**.

2.2 Facility ID Numbers

According to the UST Registration Office, there are no records of the reported historical USTs associated with the property address. Therefore, the USTs were not registered and no Facility ID Number is associated with the address.

2.3 Groundwater Incident Numbers

The Delmus Bridgers/Cash Farm Supplies UST incident (Incident No. 6695) is associated with this property. A release was discovered in 1989 upon removal of two 10,000 gallon capacity USTs. The incident was classified as low risk and closed in 2013 with a Notice of Residual Petroleum.

3.0 SITE OBSERVATIONS

3.1 Groundwater Monitoring Wells

Mid-Atlantic observed several historical groundwater monitoring wells on the Subject Site, two of which were located in the proposed right of way acquisition area or temporary construction easement (MW-2 and MW-3). The locations of these wells are shown on **Drawing 3.1**. Mid-Atlantic's technician opened the well covers and discovered that the wells are two inches in diameter and constructed of PVC. Well construction records, which are shown in CES's CSA report in **Appendix A**, show the wells as 11 feet deep. The wells have not been abandoned and the manholes and pads are still intact. A copy of the 2013 Monitoring Report, which includes a site map showing the locations of the monitoring wells constructed in association with Incident No. 6695, is provided in **Appendix A**.

3.2 Active USTs

No "Active" USTs were identified on site during our reconnaissance.

According to the owner of Scott's Automotive (next door, Parcel 22), lifts are located in the service bays at Ray's Auto facility, but these lifts are the above-ground, electric type. Based on the age of the building (built between 1980 and 1990), it is possible that these bays once utilized in-ground reservoir-type lifts.

3.3 Features Apparent Beyond ROW/Easement

Four additional monitoring wells were observed during the August 22, 2018 site reconnaissance. On the drawing provided in the 2013 Monitoring Report in **Appendix A**, two of these wells are listed as MW-5 (which is slightly outside of the parcel property line) and MW-11A. The other two wells, which are not on the drawing, are located close to MW-11A. The use of these wells is unknown. Monitoring well MW-4, which is shown on Drawing 3.1, could not be located.

Although an apparent remedial well was observed (RMW-1 on Parcel 22), no evidence of a remedial system was observed on site.

4.0 METHODS

The PSA field activities included a geophysical survey of the proposed right-of-way and temporary construction easement areas to help identify potential underground storage tanks or other subsurface anomalies that may require further investigation. Based on the results of the survey and historical information, soil and groundwater samples were collected to help identify contaminated soils and/or groundwater that may affect future roadbuilding or utility construction activities. These activities are outlined below. Field work was conducted under a Health and Safety Plan prepared by Mid-Atlantic Associates.

4.1 Geophysics

A geophysical survey of the area of concern on the Subject Site was conducted by Pyramid Geophysical Services (Pyramid) from August 22 and 23, 2018. The Geophysical survey was completed to locate subsurface utilities and buried objects such as USTs, private utilities, etc. Sub-surface utilities and buried objects were scanned using a combination of electromagnetic (EM) and ground penetrating radar (GPR) methods. A description of the geophysical survey methods used at the Subject Site are included in Pyramid's "Geophysical Survey, Metallic UST Investigation: Parcel 24, NCDOT Project U-5724" dated September 6, 2018 and included in **Appendix C.** In addition, the area of the geophysical survey is shown in the drawings provided in Pyramid's report.

4.2 Borings and Temporary Well Installation

Before fieldwork was initiated, North Carolina 811 was contacted to mark public utility service lines. Following utility location, Mid-Atlantic completed assessment activities on September 24 and 25, 2018 [Note: Mid-Atlantic's field work was delayed approximately one week due to Hurricane Florence]. The activities included collection of soil samples from the borings and installation of one temporary monitoring well in the event that evidence of contamination was encountered in the soil. The drilling and temporary well construction services were performed by Quantex, Inc. of Raleigh, North Carolina and Mid-Atlantic's technician provided oversight. Boring locations were placed on the Subject Site in areas of the right of way and construction easement. Sampling locations were evenly spaced within these areas. Two of the borings (SB-24-5 and SB-24-6) were placed near the area where the geophysical survey and surface expressions (cuts in the pavement) indicated the presence of an apparent former pump island.

4.2.1 Soil Sampling Activities

On September 24, 2018, Mid-Atlantic mobilized to the site to oversee the advancement of seven soil borings on the parcel. The work was completed during the same mobilization as sampling conducted for Parcels 5, 17, and 22. Sampling locations are shown on **Drawing 3.1**.

Using a GeoProbe "macrocore" sampling device and direct push technology (DPT), continuous soil samples were collected at each soil boring and scanned for the presence of volatile organic compounds (VOCs) using a RKI GX6000 Photo-Ionization Detector (PID). The borings were advanced to a depth of approximately 10 feet BLS (note: the water table was typically found in the 3 to 4 ft BLS range). The soils were classified for soil type and screened at approximate two-foot intervals using the PID. Boring Logs **(Appendix D)** note the PID readings and soil type descriptions recorded by Mid-Atlantic personnel as drilling progressed. In general, the soils at the site consisted of light to dark brown to tan clayey to silty fine to medium sands.

Upon completion of the borings (and completion of the borings at the other three parcels), Mid-Atlantic collected GPS coordinates on September 26, 2018 for the sampling locations using a Trimble Geo 7X unit. The coordinates were used to place the final locations of the sample points on the provided drawings.

4.2.2 Groundwater Sampling Activities

One temporary monitoring well (TMW-24-4) was installed in boring the SB-24-4 location, which exhibited elevated PID readings and a strong petroleum odor. The temporary well was constructed as follows:

- The boring was advanced using the Geoprobe's macrocore sampler through the saturated zone to a depth of 12 feet BLS (water table at 3.9 feet BLS);
- A one-inch diameter, Schedule 40 PVC well was installed with 10 feet of 0.010-inch slotted screen (screened 2 to 12) and was fitted with a threaded bottom cap and threaded riser to approximately six inches above land surface;
- A sand pack was installed from bottom of well to just above the top of the screened interval; and
- The well was developed by purging with a bailer to remove fine particles.

Upon completion of the well construction and sample collection, the well was abandoned by pulling the casing from the ground and filling the hole with soil cuttings.

4.2.3 Sample Protocol

A total of seven soil samples were collected for laboratory analysis in accordance with the Mid-Atlantic procedures located in **Appendix E.** Samples were collected into sampling containers provided by the laboratory, packed into an ice-filled cooler and shipped to Rapid Environmental Diagnostics Laboratories, LLC (RED Lab) in Wilmington, North Carolina. The soil samples were analyzed for total petroleum hydrocarbons (TPH GRO and DRO) and other constituents using the ultraviolet fluorescence (UVF) detector method.

Additionally, a groundwater sample was collected from well TMW-24-4 using the methods described in **Appendix E**. The sample was shipped to Pace Analytical Laboratories in Mt. Juliet, Tennessee, where they were analyzed for VOCs using Standard Method 6200B and SVOCs using EPA Method 625.

5.0 RESULTS

5.1 Objects

5.1.1 Underground Storage Tanks

As shown in **Appendix C**, the geophysical survey found evidence characteristic of metal reinforcement (rebar or the like) beneath the apparent former pump island, but did not find evidence of USTs existing within the area of the survey. The USTs were reportedly removed in 1989.

5.1.2 Hydraulic Lifts

Ray's Auto has service bays that utilize vehicle lifts. However, according to the owner of Scott's Automotive, these are above-ground, electric lifts (note: the owner stated that Ray's Auto has closed and another business is in the process of opening up). Based on the age of the building (built between 1980 and 1990), it is possible that these bays once utilized in-ground reservoir-type lifts. The service bays area inside of Ray's Auto could not be assessed during the geophysical survey due to spatial inaccessibility of the geophysical equipment and automotive work being conducted within the bays.

5.1.3 Monitoring Wells

Mid-Atlantic observed several historical groundwater monitoring wells on the Subject Site, two of which were located in the proposed right of way acquisition area or construction easement (MW-2 and MW-3). These wells have not been abandoned. See Section 3.1 for further information.

5.1.4 Oil-Water Separators

No Oil-Water Separators (OWS) were identified during Mid-Atlantic's completion of this PSA.

5.2 Impacted Media

Impacts to soil and groundwater, including the depths and volume calculations (if applicable), are discussed below.

5.2.1 Impacted Soil &/or Water & Groundwater

As documented in RED Lab's report located in **Appendix F** and summarized (along with PID readings) in **Table 5.1**, TPH GRO were detected in all of the seven samples at concentrations exceeding the UVF analyzer's detection limit. However, none of the samples exhibited concentrations exceeding the NCDEQ Action Level of 50 mg/kg. TPH DRO were detected in all seven samples at concentrations exceeding the UVF analyzer's detection limit. However, none of the samples exhibited concentrations exceeding the NCDEQ Action Level of 100 mg/kg. The laboratory analytical report and graphs for the soil samples collected at the site are provided in **Appendix F**. Detected chemical constituents in soil samples are shown on **Drawing 3.1.**

An assessment of water (surface water) was not included in this scope of work. Surface water was not observed on site.

A laboratory report for the groundwater sample collected from temporary monitoring well TMW-24-4 is provided in **Appendix G** summarized in **Table 5.2,** and the results are shown on **Drawing 5.1**. As summarized, petroleum fuel-related constituents were detected at concentrations exceeding the NCGQS. The more volatile constituents (e.g., benzene) are not present in the sample and the constituents detected in the sample are more representative of an older plume that has degraded over time. The impacted groundwater is likely related to the historical incident No. 6695 associated with the former UST system on site.

5.2.2 Depth

As documented in the soil boring logs and laboratory analytical reports, petroleum-impacted soil is present in the vadose zone, but concentrations do not exceed North Carolina's regulatory action levels. The depth to water in the borings ranged from approximately 3.5 feet to approximately 4.6 feet BLS. The water table may be higher than normal due to Hurricane Florence recently passing through.

It appears that the shallow groundwater has been impacted by the historical UST release at the site. Given the depth to groundwater (generally in the 3.5 to 4.5 feet BLS range, and with the potential for variance due to natural fluctuation), it is possible that impacted groundwater may be encountered during the construction of drainage or other utilities.

5.2.3 Quantities Calculation

During the advancement of the soil borings completed for this PSA, petroleum-impacted soil was encountered, but not at concentrations exceeding NCDEQ's Action Levels for TPH. Given the shallow water table and the excavation required for drainage or other utility installations, it is possible that relatively small quantities of petroleum-contaminated waste (soils and/or groundwater) could be generated during road improvement activities.

6.0 CONCLUSIONS

6.1 Interpretation of Results

Based on the results of this assessment, Mid-Atlantic concludes the following:

- A historical release of petroleum that occurred from a former UST system on site has impacted the groundwater beneath the site. Based on the depth to groundwater (approximately 3.5 to 4.6 feet BLS, with potential for natural fluctuations), it is possible that impacted soil and/or groundwater could be encountered during drainage utility and/or other construction activities.

6.2 Geophysics

Based on the results of the Geophysical assessment, Mid-Atlantic concludes the following:

- The geophysical survey found evidence characteristic of metal reinforcement (rebar or the like) beneath the apparent former pump island, but did not find evidence of USTs existing within the area of the survey. The USTs were reportedly removed in 1989.
- Although the service bays of Ray's Auto are reported to have above-ground electric lifts, it is possible that in-ground reservoir lifts could have been historically used there. These areas could not be accessed during the geophysical survey.

6.3 Sampling

Based on the results of the sampling, Mid-Atlantic concludes the following:

- Based on the seven soil borings advanced at the site, vadose zone contamination was not encountered at concentrations exceeding North Carolina's regulatory action levels, but small quantities of soil waste could be generated if soils in the saturated zone are excavated for utility installation;

- Petroleum-impacted groundwater exceeding the NCGQS was encountered in a temporary well installed at location TMW-24-4. This contamination is likely associated with the historical UST system release on the site.

6.4 Groundwater

- Given the depth to groundwater (generally in the 3.5 to 4.5 feet BLS range, and with the potential for variance due to natural fluctuation), it is possible that impacted groundwater may be encountered during the construction of drainage or other utilities.

6.5 Quantities

- During the advancement of the soil borings completed for this PSA, petroleum-impacted soil was encountered, but not at concentrations exceeding NCDEQ's Action Levels for TPH. Given the shallow water table and the excavation required for drainage or other utility installations, it is possible that relatively small quantities of petroleum-contaminated waste (soils and/or groundwater) could be generated during road improvement activities.

7.0 RECOMMENDATIONS

Based on these results, Mid-Atlantic recommends the following:

- If utility construction is to take place in the current location of the service bays of Ray's Auto, additional investigation should be conducted to determine if in-ground hydraulic lifts exist in this area;

- If encountered during drainage or other utility installation, residual soil contamination should be properly managed and disposed; and

- Since impacted groundwater is present at a relatively shallow depth (3.5 to 4.5 ft BLS range, with variations due to natural fluctuation), it is possible that it could be encountered during drainage utility construction or operation. Mid-Atlantic recommends constructing a sealed drainage system to prevent potentially impacted water from entering the pipes. If groundwater is encountered during construction, it should be containerized and properly managed and disposed.

Scott,

Just thought I would update you on the status of the Monitoring Report. I'm waiting on Paul, Delmus's son to find evidence of the last time they used the tanks so I can finish the eligibility form. As I mentioned before, the hardware store caught fire several years ago and burnt up all their files.

MONITORING REPORT

CASH FARM SUPPLIES/DELMUS BRIDGER'S SITE
1003 NORTH BERKELEY BLVD., WAYNE COUNTY, NC
INCIDENT NUMBER: 6695
RISK CLASSIFICATION: INTERMEDIATE
RANKING: I 140-D

DATE OF REPORT
19 JULY 2013

I. INTRODUCTION

A. ***Site Location****. Cash Farm Supplies (Delmus Hardware) is located at the southwest corner of Highway 70 West and Highway 581, Goldsboro, NC. A location map showing the site location can be seen in Appendix A, Enclosure 1.*

B. Underground Storage Tanks. *Two (2) 10,000-gallon underground storage tanks (UST) used to store gasoline were installed in June 1969. On 26 April 1991 during a tank closure, groundwater samples were collected for laboratory analysis. Lab results on the collected water samples were sent to the Division of Environmental Management (DEM) in Washington. On 31 May 1991 Delmus Bridgers was issued a Notice Of Violation(NOV) from the DEM and was requested to conduct a Comprehensive Site Assessment (CSA). The CSA was completed and a report, dated 14 January 1992 was submitted to the DEM. The site was recently issued a NORR dated 1 May 2012 requesting a Groundwater Monitoring Report be conducted.*

II. GROUNDWATER SAMPLING RESULTS

A. ***Summary of Current Groundwater Sampling Results.*** *A total of ten (10) monitoring wells were sampled from wells sampled for previous groundwater investigations. These wells are identified as MW-11A, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, & MW-10. Three of the wells, MW-7, MW-8, & MW-9 had been destroyed from construction activity which had taken place over the years so only seven (7) of the ten (10) wells were sampled. A map showing the well locations can be seen in Appendix A, Enclosure 2. Laboratory results can be seen in Appendix B. A table summarizing these results is shown below:*

Date Sampled	*Sample Location*	*Parameter Exceeding 2L Standard*	*Concentration ug/l*	*2L Standard ug/l*	*Laboratory Method*
6/26/2013	*MW-11A*		*ND*		*8260B*
6/26/2013	*MW-2*		*ND*		*8260B*
6/26/2013	*MW-3*		*ND*		*8260B*
6/26/2013	*MW-4*		*ND*		*8260B*
6/26/2013	*MW-5*		*ND*		*8260B*
6/26/2013	*MW-6*	*Benzene*	*8.1*	*1.0*	*8260B*
		Ethylbenzene	*450*	*600*	
		Toluene	*23*	*600*	
		Xylenes	*690*	*500*	
6/26/2013	*MW-7*		*NS*		
6/26/2013	*MW-8*		*NS*		
6/26/2013	*MW-9*		*NS*		
6/26/2013	*MW-10*		*ND*		*8260B*

Note:

ug/l = part per billion

ND = No parameters detected

NS = Not sampled due to well being destroyed

8.1 = Highlighted numbers exceed 15A NCAC 02L .0202 groundwater standards

III. CONCLUSIONS/SUMMARY

A. Ten monitoring wells were selected for groundwater collection. Three of the wells had been destroyed so only seven of the existing wells were sampled. Out of the seven wells sampled, only one well, MW-6, had parameters detected by the laboratory using Method 8260B. This well had two parameters detected which exceeded the 15A NCAC 02L .0202 groundwater standard. These were Benzene and total Xylenes.

I. INTRODUCTION

This report covers the operations and findings to-date for an unscheduled discharge from an underground storage tank (UST) containing petroleum product at subject facility, located at 1003 North Berkeley Boulevard, Goldsboro, N. C. The purpose of the CSA is twofold: (1) Define the extent of soil and groundwater contamination in order to provide the necessary information for a Corrective Action Plan (CAP); (2) Separate the area of contamination at subject site from an isolated event of soil and groundwater contamination, which occurred approximately six (6) to seven (7) hundred feet northeast of the site and is currently known as the Happy Store.

II. SITE HISTORY

A. The UST's formerly located at subject site were first installed in June of 1969, and were used in conjunction with a service station which operated from June 1969 until March 1981.

B. On 25 August 1989, Mr. Jim Crumpler of Crumpler Construction Company excavated and removed two (2) ten thousand

(10,000) gallon gasoline tanks. In December 1990, Mr. Crumpler hand-delivered analytical results from two (2) composite soil samples collected from the excavated pit to the Groundwater Section at the Washington Regional Office. One of the two composite samples had a concentration of 32 parts per million (ppm) which is above the 10 ppm action level established by the Division of Environmental Management (DEM). As a result, DEM in a letter to Mr. Delmus Bridgers, dated 4 March 1991, recommended groundwater samples from the tank pit area be collected and analyzed per EPA Method 602 (with xylenes and MTBE).

C. On 7 March 1991, Mr. Bridgers submitted an Application for Permit to Construct Monitoring Wells to DEM; and subsequently retained the services of Contractors and Engineers Services, Inc., (CES) to install the monitoring wells and collect the recommended samples.

D. On 1 April 1991, CES installed three (3) temporary monitoring wells at locations recommended by DEM. See enclosed Drawing 795, 2/2. These wells are identified as TW-1, TW-2 and TW-3. Samples taken from the wells were analyzed per EPA Method 602 (with xylenes and MTBE), and the results sent to DEM on 26 April 1991.

E. On 31 May 1991, DEM issued Mr. Bridgers a Notice of Violation (NOV) of State groundwater standards, and advised that

he comply with the necessary requirements in order to assess the extent of contamination. As a result of the NOV, Mr. Bridgers retained the services of CES to perform the CSA.

III. CONTAMINANT SOURCE INVENTORY

A. Potential Petroleum Hydrocarbon Sources on Site. There are presently no potential sources of petroleum hydrocarbon on site. The only sources which existed prior to this report were the two (2) UST's removed in August 1989.

B. Potential Off-Site/Upgradient Sources. Potential for contamination from offsite sources exist approximately three hundred (300) feet east from subject site. This site, currently known as the Happy Store, was formerly the location of the Sav-A-Ton gasoline station. On 25 March 1988, Triton, Inc. (owners of Sav-A-Ton) were issued a Notice of Noncompliance by DEM for the contamination of groundwater from leaking above-ground fuel tanks and related underground piping. To-date, this site is still contaminated; and, due to the direction of groundwater flow within the area, poses a threat to property downgradient.

IV. POTENTIAL RECEPTORS/SITE UTILITIES

A. Local Land Ownership and Population Density. Subject property is owned by Delmus Bridgers, and is located within

the Goldsboro City Limits along the east side of the city boundary line. Population density is approximately 33,000.

B. Surrounding Land Use. Berkeley Junction Shopping Center is bordered on the northeast by Atlantic and East Railroad (AER). The property northeast of AER and adjacent to NCSR 1560 is owned and operated by Lowe's Hardware. Northeast of subject property and located at the intersection of Berkeley Blvd. and Miller Road is the property on which the Happy Store is located. Southwest of the Happy Store and east of subject site lies an apartment complex. Southwest of subject site is the location of Saul's Wheel Alignment & Motor Service. See Drawing 795, 1/2.

C. Downgradient Water Supply Wells. There are no active wells within 1500 feet of the contamination source. All water used within this area is supplied by the City of Goldsboro.

D. Municipal Water Lines. All water lines within proximity of the site are shown on enclosed Drawing 795, 2/2.

E. Location of Structures Potentially at Risk from Free-Product or Vapor Hazards. At the current stage of investigation, no free-product has been observed. All structures at potential risk from free-product and associated vapors, should they occur, are shown on enclosed Drawing 795, 2/2.

F. Site Utility Lines. All utility lines located on subject site and adjacent right of ways are shown on enclosed Drawing 795, 2/2. All preferential migration pathways for

contaminants are indicated on the enclosed drawing, either by invert elevation of the utilities or notes which state the direction of the preferential pathway.

V. SITE TOPOGRAPHY AND SURFACE WATER FEATURES

A. Base Map of Regional Topography. A base map showing the regional topography and site location is shown in Appendix I, Figure 1.

B. Base Map of Site Topography. A base map showing the site topography, sources of contamination and surface water features (if present) is shown on enclosed Drawing 795, Sheet 1/2.

C. Land Cover, Direction of Drainage and Storm Drains. The site cover consists of asphalt paving with a section of property located behind the shopping complex existing as a grassed area used for storage. The contamination plume on subject site lies under existing asphalt. Drainage of the property is in a southwest direction with a slope of approximately 1%. One storm drain is located near the southeast edge of the property adjacent to Berkeley Blvd., and drains southwest along Berkeley Blvd. See Drawing 795, 2/2.

VI. SITE SOILS AND GEOLOGY

A. Soil Boring Results

1. A total of ten (10) soil borings were performed during the site assessment. All ten borings were performed

for the installation of monitoring wells MW-1 through MW-10. See enclosed Drawing 795, 1/2, for location. Boring logs can be found in Appendix I, Enclosures 1 - 10, and are classified using the Unified Soil Classification System.

2. Nine (9) of the ten (10) soil borings (MW-2 - MW-10) indicate a relatively uniform layering of soils consisting of silty sands (SM), silty sand-poorly graded sand mixture (SM-SP), and a poorly graded sand (SP). Silty sands occupy the top layer and range from five (5) to seven (7) feet in thickness. The second layer consists of a silty sand-poorly graded sand, ranges in depth from five (5) to nine (9) feet, and varies in thickness from one-half (0.5) foot to two (2) feet. Borings into the third layer terminated at eleven (11) feet. This layer has been identified as a poorly graded sand, and ranged in thickness from two (2) to six (6) feet.

3. The soil boring for MW-1 was made within the former tank site, and showed a well graded sand backfill to a depth of seven (7) feet. The remaining four (4) feet of the boring was identified as a silty sand-poorly graded sand mixture.

B. Cross-Sections of Soil Borings. See enclosed Drawing 795, 1/2.

C. Geologic Formation of the Site and Surrounding Region

1. Wayne County is located within the Coastal Plains of Eastern North Carolina. The area is characterized by gently rolling land, with the largest amount of relief located near rivers and streams.

2. The Goldsboro area is mostly occupied by outcrops of the Black Creek Formation along the Neuse River (Richards 1950). The type of soils and minerals found in the Black Creek Formation consist of thinly laminated clay layers and lenses of sand (Pusey 1960). Mica and Lignite are common, also, to include Marcasite or Pyrite which occur as concentrations, disseminated grains, or as replacement minerals in lignitized wood fragments (Pusey 1960). Glauconite and occasional specimens of Foraminifera are in minor amounts in the lower part of the formation (Pusey 1960).

3. The soils located in the area of Berkeley Junction Shopping Center are characteristic of the upper section of the Black Creek Formation.

VII. EXTENT OF SOIL CONTAMINATION

A. Soil samples were collected from seven (7) of the ten (10) borings, and are identified as MW-1 through MW-7. The vertical extent of each borehole was checked with an Organic Vapor Analyzer (OVA) in order to locate the depth

containing the highest Total Petroleum Hydrocarbon (TPH) level. The depth of each sample collected was eleven (11) feet for each boring. Out of the seven samples submitted for analysis, four (4) contained TPH levels exceeding the State action level of ten (10) ppm, and are identified as MW-1, MW-2, MW-4 and MW-6. Respective TPH levels for each sample analyzed are 1392, 821, 28.4 and 950 ppm. The estimated plume boundary for soil contamination is shown on enclosed Drawing 795, 2/2, along with the tabulated results. Laboratory results along with chain of custody forms can be found in Appendix I, Enclosures 11-13. Headspace reading recorded from OVA readings can be found in Appendix I, Enclosure 14.

VIII. SITE HYDROGEOLOGY

A. Monitoring Well Network. A total of ten (10) monitoring wells circumvent the former UST location. Two (2) of the ten wells were placed off site along the southern edge of Berkeley Blvd. in order to see if groundwater contamination had spread in that direction. Monitoring well locations can be found on enclosed Drawing 795, 1/2. Well construction records can be found in Appendix I, Enclosures 15 - 24.

B. Static Water Level Measurements. All wells were measured based on an assumed finished floor elevation of 100.00 of

the existing shopping center complex. The top of each well casing was shot with a Wild Nak-0 Level. The depth to the water table was then measured with a Solinst electric tape. This measurement was then deducted from the top of well casing elevation to obtain the static water level. Two sets of static water level measurements were made. The first set of measurements were made on 23 October 1991, followed by a final measurement on 31 December 1991. Flow direction in both instances reveals a groundwater gradient sloping in a northeast to southwest direction. The flow nets for each measurement period can be found on enclosed Drawing 795, 2/2, and Drawing 795, 2/1, along with the tabulated measurements for each well.

C. Aquifer Test. A slug test was performed on 18 December 1991 by using the Hvorslev method. The test was performed using monitoring well MW-2, and yielded a hydraulic conductivity of 7.84×10^{-5} ft./sec. or 2.39×10^{-4} cm/sec.

D. Anisotropy. As shown on Drawing 795, 1/2, the aquifer down to eleven (11) feet exhibits a series of layered sedimentary soils identified as an SM, SM-SP, and SP. No confining layers were encountered during the borings. Due to the higher vertical effective stress in these soils, and

the corresponding horizontal particle alignment of the silt particles, the horizontal permeability within this area should exceed the vertical.

E. Seasonal Fluctuation in Groundwater Flow. Two separate measurements of groundwater flow direction indicate that flow is in a northeast to southwest direction. Each set of groundwater contours exhibits the same pattern; and, due to the natural steep surface gradient within this area, any reversal from the existing east to west direction is not anticipated. See enclosed Drawings 795, 1/2 and 2/2.

IX. EXTENT OF GROUNDWATER CONTAMINATION

A. Horizontal Extent of Contamination.

1. Ten (10) monitoring wells were installed on and adjacent to subject site. Only three (3) of the ten monitoring wells showed evidence of groundwater contamination with respect to petroleum hydrocarbons found in gasoline. These three wells are identified as MW-1, MW-2 and MW-6. Laboratory results along with chain of custody forms can be found in Appendix 1, Enclosures 25 - 29.

2. The highest TPH level was found in MW-2 with a TPH of 151.0 ppm. MW-6 had a TPH of 51.0 ppm, and MW-1 had a TPH of 32.7 ppm. With MW-1 being located in the center of the old tank site, and MW-2 being located 165 feet

downgradient from MW-1, it would appear that the main body of contamination is migrating in a northeast to southwest direction. It should be noted, however, that samples collected during the preliminary site assessment on 1 April 1991 indicated varying levels of TPH within the area of the old tank site. One sample taken on 1 April came from Temporary Well TW-1 and measured 8.58 ppm TPH. This well was located next to the present location of MW-1 which on 28 October 1991 had a TPH of 32.7 ppm. The remaining two (2) temporary wells (TW-2 and TW-3) had respective TPH levels of 150 ppm and 76.2 ppm. When this data is reviewed, it appears that there are scattered locations within the plume that have higher concentrations of TPH than others, making it difficult to plot isoconcentration contours.

3. The plume is being drawn in a northeast to southwest direction along a groundwater gradient of approximately 0.5%. It is suspected that the main reason for the drawn-out appearance of the plume - aside from the gradient along which it is travelling - is due to the underground utilities located along subject site creating preferential pathways for the contaminants.

4. One of the main concerns of the CSA was to determine if contamination had spread from the Happy Store site onto

subject site, or if contamination had spread from subject site east across Berkeley Blvd., and was responsible for reported groundwater contamination located within the existing apartment complex. In order to isolate the plume within subject site, Monitoring Wells MW-4, MW-7, MW-8 and MW-9 were installed. Wells MW-8 and MW-9 were placed on the east side of Berkeley Blvd. bordering the apartment complex property. Monitoring Wells MW-4 and MW-7 were placed on the northeast side of subject site. All four wells were non-contaminated with respect to petroleum compounds found in gasoline. As a result, the groundwater contamination found on subject site does appear to be confined to the area designated on enclosed Drawing 795, 2/2, and does not appear to be responsible for the reported contamination within the apartment complex.

B. Vertical Extent of Contamination. Boring logs did not reveal a confining layer down to a depth of eleven (11) feet; therefore, the actual vertical extent of contamination is not known with regard to water table fluctuation. Depths to the groundwater have remained at approximately six (6) feet below ground surface during the course of our investigation. See enclosed Drawing 795, 1/2. A water sample collected at subject site by DEM on

22 February 1988 (and identified as TW-4 on Drawing 795, 2/2) indicated the water table was six (6) feet below land surface. See Appendix 1, Enclosure 30. Soil samples collected from Borings MW-1 through MW-7 were taken at a depth of eleven (11) feet, and all samples analyzed revealed petroleum hydrocarbon levels ranging from 6.13 ppm to 1392 ppm. This would, therefore, indicate that the vertical extent of groundwater contamination extends down to this depth in some places.

X. PRELIMINARY EXPOSURE ASSESSMENT

A. Major Contaminants

1. The major contaminants found in the groundwater were benzene, ethylbenzene, toluene, xylenes and methyl-tertiary-butyl ether (MTBE). Benzene, a Group A carcinogen[1], was found with levels ranging from 82 ppb to 1140 ppb. The half-life of benzene in soils and aquifer materials may be less than one year[2-4], which some studies have shown the half-life of benzene (as gasoline) to be 36 days[5].

2. There is currently no hard evidence to suggest that the remaining four hydrocarbons (ethylbenzene, toluene, xylenes and MTBE) are carcenogenic; however, xylene and toluene both are reported to produce nervous system effects at high doses.[5]

B. Risk of Potential Health Effects

1. The risk of potential health effects appears to be minimal. The plume is confined under asphalt, and does not appear to have spread under any existing structures. No free-product has been observed in any of the wells being monitored.

2. There are currently no domestic wells being used within 1500 feet of the site which could cause alarm as a human exposure pathway. The only possible future source of contact with the contamination source will exist when the City of Goldsboro extends their sewer system as shown on enclosed Drawing 795, 2/2. As a result, the City has been informed of the situation.

XI. PRELIMINARY EVALUATION OF REMEDIAL ALTERNATIVES

A. Remedial Alternative No. 1. Alternative No. 1 would be to install a recovery well and pump within the plume and create a cone of depression, thus drawing the contaminated groundwater to a control point and preventing migration of the plume. An insitu soil venting system would be installed in order to remove vapors from the soil. The main advantage of this method is the containment of the plume. Disadvantages lie with the shape of the plume itself. The plume is longitudinal in shape; and, due to its length versus width, the majority of the cone of

depression would extend into uncontaminated regions north and south of the plume. If this method was employed, two recovery wells would probably be necessary (one upgradient and one downgradient) in order to have a positive effect on recovery of groundwater contamination. Estimated cost for this alternative, excluding reports, can be found in Appendix I, Enclosure 31.

B. Remedial Alternative No. 2. Alternative No. 2 would employ the same method for soil remediation as Remedial Alternative No. 1. However, the method for recovery of contaminated groundwater would consist of a trench system extending the length of the plume. The proposed trench will be approximately eight feet deep and will have a four-inch slotted PVC pipe extending along the trench base. A recovery pump will be installed at the downgradient end of the trench. The trench will be approximately 300 feet long with the first 150 feet being installed adjacent to the proposed sewer line being installed by the City. By laying the PVC pipe in conjunction with the sewer line, the cost to the client will be cut in half. There are no foreseen disadvantages to this alternative. Advantages would be a more effective recovery system, thus reducing long term operations and cost. Estimated cost for this alternative,

excluding reports, can be found in Appendix I, Enclosure 32.

EXECUTIVE SUMMARY

Project Description: Pyramid Environmental conducted a geophysical investigation for Mid-Atlantic Associates, Inc. at Parcel 24, located at 1003 North Berkeley Boulevard, in Goldsboro, NC. The survey was part of a North Carolina Department of Transportation (NCDOT) Right-of-Way (ROW) investigation (NCDOT Project U-5724). The survey was designed to extend from the existing edge of pavement into the proposed ROW and/or easements, whichever distance was greater. Conducted from August 22-23, 2018, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

Geophysical Results: The geophysical investigation consisted of electromagnetic (EM) induction-metal detection and ground penetrating radar (GPR) surveys. A total of eighteen EM anomalies were identified. The majority of the EM anomalies were directly attributed to visible cultural features at the ground surface. Four EM anomalies were associated with suspected reinforced concrete, a well, or vehicle interference and were further investigated with GPR. GPR verified the presence of metal reinforcement beneath the asphalt at the location of an apparent former pump island (based on surface expressions such as cuts in the existing asphalt). GPR identified buried utilities extending away from the apparent pump island (possible former power or product lines). No evidence of larger structures was observed. The remaining GPR transects did not record any evidence of significant buried structures. Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 24.

INTRODUCTION

Pyramid Environmental conducted a geophysical investigation for Mid-Atlantic Associates, Inc. at Parcel 24, located at 1003 North Berkeley Boulevard, in Goldsboro, NC. The survey was part of a North Carolina Department of Transportation (NCDOT) Right-of-Way (ROW) investigation (NCDOT Project U-5724). The survey was designed to extend from the existing edge of pavement into the proposed ROW and/or easements, whichever distance was greater. Conducted from August 22-23, 2018, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

The site included an active service garage in a shopping plaza surrounded by grass, asphalt, and gravel surfaces. An aerial photograph showing the survey area boundaries and ground-level photographs are shown in **Figure 1**.

FIELD METHODOLOGY

The geophysical investigation consisted of electromagnetic (EM) induction-metal detection and ground penetrating radar (GPR) surveys. Pyramid collected the EM data using a Geonics EM61-MK2 (EM61) metal detector integrated with a Geode External GPS/GLONASS receiver. The integrated GPS system allows the location of the instrument to be recorded in real-time during data collection, resulting in an EM data set that is geo-referenced and can be overlain on aerial photographs and CADD drawings. A boundary grid was established around the perimeter of the site with marks every 10 feet to maintain orientation of the instrument throughout the survey and assure complete coverage of the area.

According to the instrument specifications, the EM61 can detect a metal drum down to a maximum depth of approximately 8 feet. Smaller objects (1-foot or less in size) can be detected to a maximum depth of 4 to 5 feet. The EM61 data were digitally collected at approximately 0.8-foot intervals along north-south trending or east-west trending,

generally parallel survey lines, spaced five feet apart. The data were downloaded to a computer and reviewed in the field and office using the Geonics NAV61 and Surfer for Windows Version 15.0 software programs.

GPR data were acquired across select EM anomalies on August 23, 2018, using a Geophysical Survey Systems, Inc. (GSSI) UtilityScan DF unit equipped with a dual frequency 300/800 MHz antenna. Data were collected both in reconnaissance fashion as well as along formal transect lines across EM features. The GPR data were viewed in real-time using a vertical scan of 512 samples, at a rate of 48 scans per second. GPR data were viewed down to a maximum depth of approximately 6 feet, based on dielectric constants calculated by the DF unit in the field during the reconnaissance scans. GPR transects across specific anomalies were saved to the hard drive of the DF unit for post-processing and figure generation.

Pyramid's classifications of USTs for the purposes of this report are based directly on the geophysical UST ratings provided by the NCDOT. These ratings are as follows:

Geophysical Surveys for Underground Storage Tanks
on NCDOT Projects

High Confidence	Intermediate Confidence	Low Confidence	No Confidence
Known UST Active tank - spatial location, orientation, and approximate depth determined by geophysics.	**Probable UST** Sufficient geophysical data from both magnetic and radar surveys that is characteristic of a tank. Interpretation may be supported by physical evidence such as fill/vent pipe, metal cover plate, asphalt/concrete patch, etc.	**Possible UST** Sufficient geophysical data from either magnetic or radar surveys that is characteristic of a tank. Additional data is not sufficient enough to confirm or deny the presence of a UST.	Anomaly noted but not characteristic of a UST. Should be noted in the text and may be called out in the figures at the geophysicist's discretion.

DISCUSSION OF RESULTS

Discussion of EM Results

A contour plot of the EM61 results obtained across the survey area at the property is presented in **Figure 2**. Each EM anomaly is numbered for reference in the figure. The

following table presents the list of EM anomalies and the cause of the metallic response, if known:

LIST OF METALLIC ANOMALIES IDENTIFIED BY EM SURVEY

Metallic Anomaly #	Cause of Anomaly	Investigated with GPR
1	Well	☑
2	Vehicles	☑
3	Sign	
4	Manhole	
5	Reinforced Concrete	☑
6	Vehicles	☑
7	Sign	
8	Drop Inlet	
9	Sign	
10	Suspected Utility	
11	Manhole	
12	Utilities/Well	
13	Guy Wires	
14	Sign	
15	Utility/Sign	
16	Utility	
17	Water Meter	
18	Trailer/Signs	

The majority of the EM anomalies were directly attributed to visible cultural features at the ground surface, including wells, vehicles, signs, a drop inlet, utilities, manholes, guy wires, a water meter, and a trailer. Anomaly 1 was associated with a well and was further investigated with GPR. Anomaly 2 and Anomaly 6 were associated with vehicles on the site and were further investigated with GPR. Anomaly 5 was associated with reinforced concrete and was further investigated with GPR to confirm the presence of metal reinforcement and that no larger structures are present beneath the reinforcement.

Discussion of GPR Results

Figure 3 presents the locations of the GPR transects performed at the property, as well as the transect images. A total of five GPR transects were recorded. Transects 1-3 were

collected across EM Anomalies 5-6. These transects showed evidence of metal reinforcement and did not show any signs of larger structures beneath the reinforcement. This area containing metal reinforcement exhibited a surface expression that appeared to be associated with a former pump island. GPR identified buried utilities extending away from the apparent former pump island (possible former power or product lines). These lines were traced outside of the area of interest, but did not lead to any apparent USTs.

Transect 4 was collected across EM Anomaly 1. This transect showed a small hyperbolic reflector associated with a well and did not show any signs of larger structures.

Transect 5 was collected across EM Anomaly 2. This transect showed no evidence of significant buried structures.

Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 24. **Figure 4** provides an overlay of the geophysical survey onto the NCDOT MicroStation engineering plans for reference.

SUMMARY & CONCLUSIONS

Pyramid's evaluation of the EM61 and GPR data collected at Parcel 24 in Goldsboro, North Carolina, provides the following summary and conclusions:

- The EM61 and GPR surveys provided reliable results for the detection of metallic USTs within the accessible portions of the geophysical survey area.
- The majority of the EM anomalies were directly attributed to visible cultural features at the ground surface.
- Four EM anomalies were associated with suspected reinforced concrete, a well, or vehicle interference and were further investigated with GPR.
- GPR verified the presence of metal reinforcement beneath the asphalt at the location of an apparent former pump island (based on surface expressions such as cuts in the existing asphalt). GPR identified buried utilities extending away from the apparent pump island (possible former power or product lines). No evidence of

larger structures was observed.

- The remaining GPR transects did not record any evidence of significant buried structures.
- Collectively, the geophysical data did not record any evidence of metallic USTs at Parcel 24.

LIMITATIONS

Geophysical surveys have been performed and this report was prepared for Mid-Atlantic Associates, Inc. in accordance with generally accepted guidelines for EM61 and GPR surveys. It is generally recognized that the results of the EM61 and GPR surveys are non-unique and may not represent actual subsurface conditions. The EM61 and GPR results obtained for this project have not conclusively determined the definitive presence or absence of metallic USTs, but the evidence collected is sufficient to result in the conclusions made in this report. Additionally, it should be understood that areas containing extensive vegetation, reinforced concrete, or other restrictions to the accessibility of the geophysical instruments could not be fully investigated.

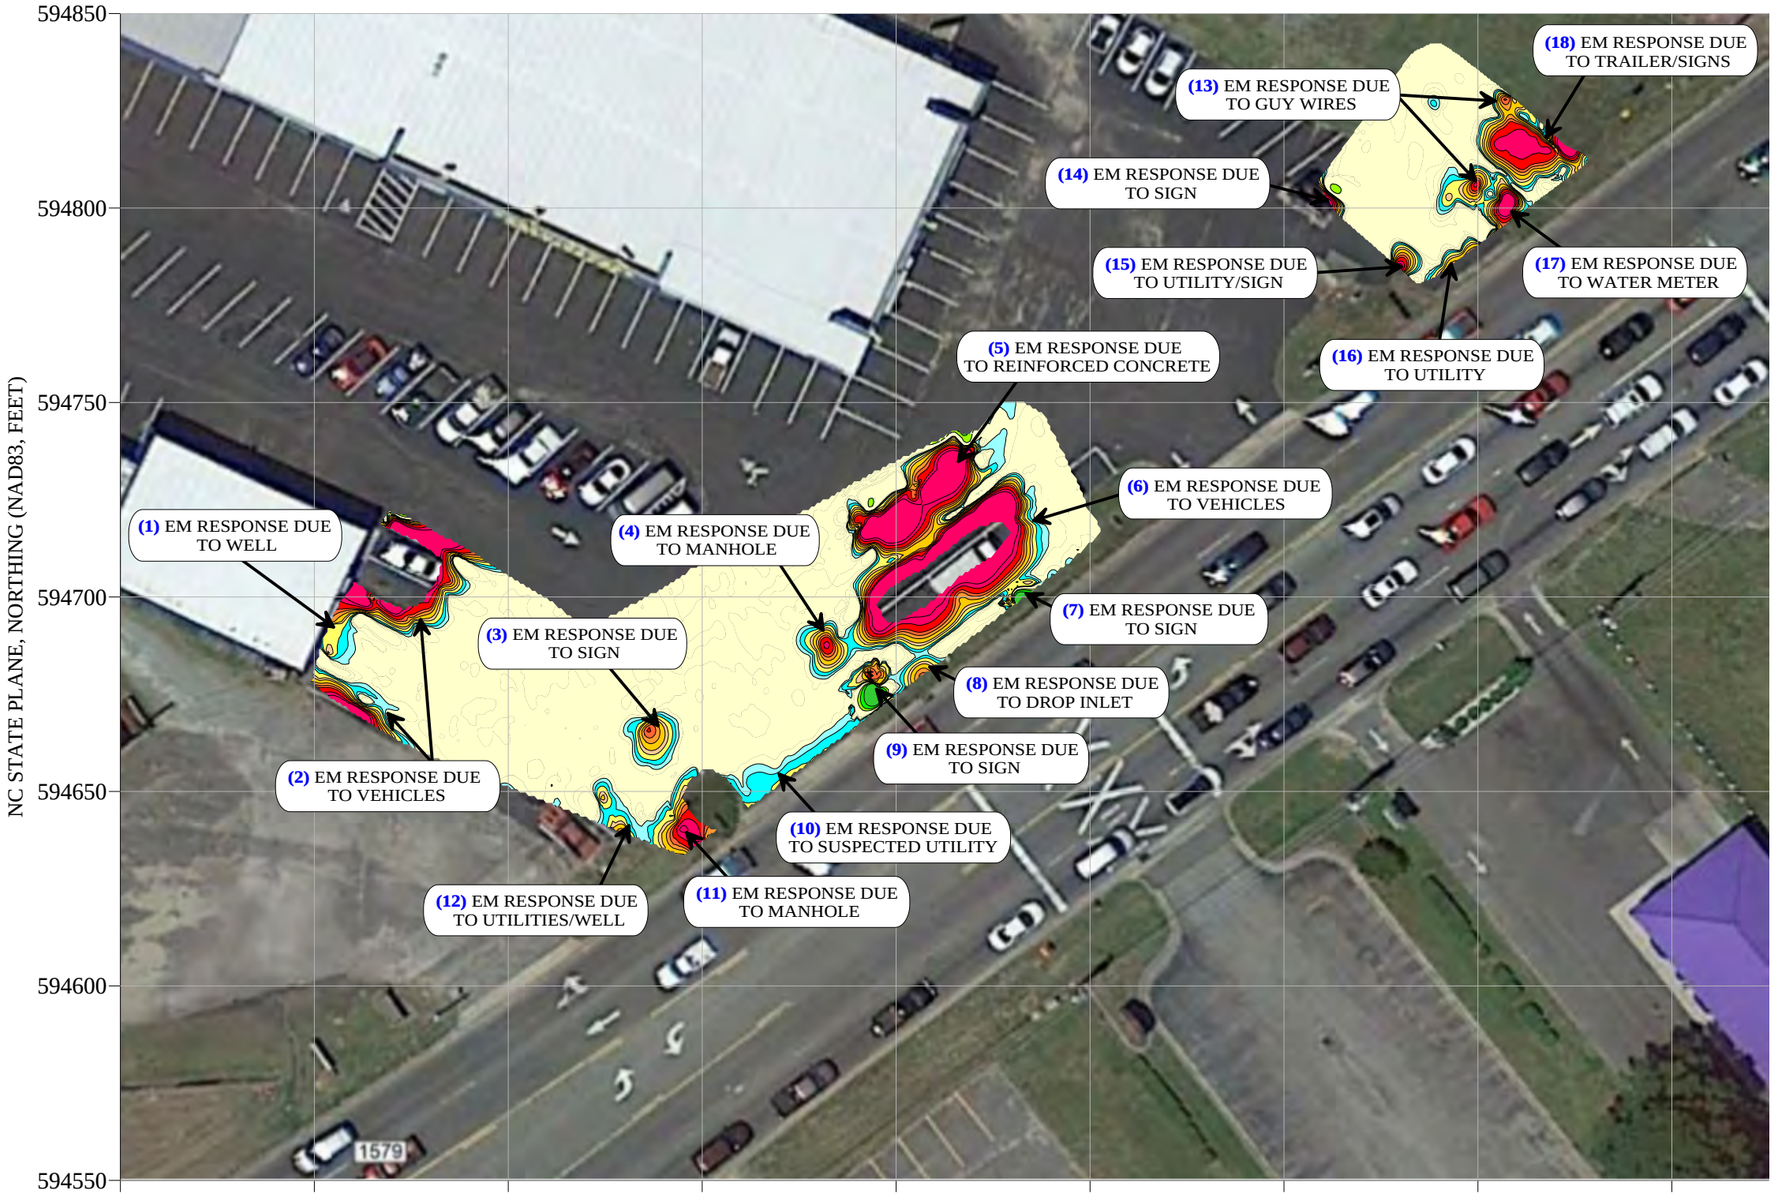
EM61 METAL DETECTION RESULTS



NO EVIDENCE OF UNKNOWN METALLIC USTs OBSERVED.

The southwestern portion of the contour plot shows the differential results of the EM61 instrument in millivolts (mV). The differential results focus on larger metallic objects such as USTs and drums. The northeastern portion of the contour plot shows the bottom coil data results of the EM61 instrument in millivolts (mV), which provide a stronger metallic response of the instrument and do not incorporate the top coil. Differential data (difference between top and bottom coils) were not used for the NE area due to interference. The EM61 data were collected on August 22, 2018, using a Geonics EM61 instrument. Verification GPR data were collected using a GSSI UtilityScan DF instrument with a dual frequency 300/800 MHz antenna on August 23, 2018.

APPENDIX E

MID-ATLANTIC FIELD PROCEDURES

Mid Atlantic
Engineering & Environmental Solutions

Soil Sampling Procedures

I. Sample Collection

Direct Push Technology (DPT, or "Geoprobe")

DPT uses a truck-mounted hydraulic rig to push a steel sampling probe into the subsurface to collect soil and/or groundwater samples. The sampling device used to collect the soil samples during this investigation was the "macrocore" sampler. This sampler consists of a four-foot long, two-inch diameter stainless steel spoon containing a clear, acetate liner. When the macrocore sampler is driven into the subsurface, the soil is collected into the acetate liner and then retrieved to the land surface. The liner is then cut open and the soil lithology is characterized and soil samples are collected.

Split Spoon Sampling

This method of soil sampling is typically used during advancement of hollowstem augers for the construction of monitoring wells. Soil samples are obtained from the borings by driving a prewashed, 1-3/8-inch inner-diameter split-spoon sampler at five foot intervals to termination in general accordance with ASTM D-1586 (Standard Penetration Test) specifications. Blow counts for each six inches of split-spoon penetration are recorded during advancement of the spoon. Samples are then retrieved to the land surface, the split-spoon is opened, and the soil lithology is characterized and soil samples are collected.

Hand Augering

This method is typically used for shallow sampling in areas where access is limited or underground obstacles such as utilities may be present. A pre-washed, three-inch diameter steel auger bucket is attached to extension rods and manually turned to penetrate the subsurface to the desired sampling depth. Samples are then retrieved to the land surface and the soil lithology is characterized and soil samples are collected directly from the hand auger bucket.

Excavator Bucket Sampling

This method is typically used during UST excavation and soil excavation projects. The soil samples are collected from the excavator bucket when it is not safe to collect the samples by other means. Care is taken when collecting samples from the bucket to avoid soil that has come in contact with the bucket itself to avoid cross contamination.

II. Headspace Field Screening

A portion of each sample is removed from the sampling device and placed in a pre-labeled, plastic "ziploc" bag. After several minutes, the gas contained in the "headspace" or void area within the bag is tested with a photoionization detection (PID) and/or Flame Ionization Detector (FID). These are useful as scanning devices to detect the presence of volatile organic compounds (VOCs) but are not relied upon to determine specific levels of contamination. Typically, the samples exhibiting the highest headspace readings will be submitted to the laboratory for analysis.

III. Preparation for Laboratory Analysis

The sample collector dons new nitrile sampling gloves prior to handling each sample. The samples are placed into laboratory-prepared, pre-labeled, sampling containers, packed in ice, and shipped to a certified laboratory under chain-of-custody control. The sampler places an executed custody seal on the cooler prior to leaving the sampler’s custody. Laboratory analyses to be performed on the samples, along with other sampling information, are specified on the chain-of-custody, which is placed in the cooler with the samples.

Groundwater Sampling Procedures

I. Sample Collection

A. Monitoring Wells

Prior to sample collection, each well is purged of three to five standing well volumes or to dryness to remove stagnant water from the well and well bore in an effort to collect samples that are representative of the water quality in the formation surrounding each well. Purging is performed either with a new, polyethylene bailer dedicated to each well, or with a decontaminated pump. Samples are retrieved from the monitoring well using the dedicated bailer. New nylon string is used on each dedicated bailer, and new nitrile sampling gloves are donned prior to purging and sampling of each well.

B. Geoprobe “Screen Point Sampler”

The screen point sampler is a “grab” sampling device that is driven into the saturated zone and a surrounding metal sheath is retracted, exposing a screen. Groundwater entering the screen is then drawn to land surface through disposable tubing that is placed through the hollow push rods. The sample is collected from the tubing into the appropriate sampling glassware.

C. Water-Supply Wells

Water samples are typically collected from the available spigot that is nearest to the well. The water is allowed to run at a high flow from the spigot for approximately 10 to 15 minutes to allow the water in the delivery lines to be purged. The sample flow is then reduced and the samples are collected directly into pre-labeled containers as described below. New nitrile sampling gloves are donned prior to sampling of each well.

D. Treatment System Influent/Effluent

Samples are typically collected from the influent or effluent of pump-and-treat groundwater remediation systems using designated sampling ports in the influent and effluent water transport lines. The water is typically allowed to run for several seconds to clear potential debris in the sampling port. The sample is then collected directly into sampling containers as described below. New nitrile sampling gloves are donned prior to sample collection.

II. Preparation for Laboratory Analysis

Groundwater samples are decanted directly into laboratory-prepared, pre-labeled, sampling containers, packed in ice, and shipped to a certified laboratory under chain-of-custody control. Laboratory analyses performed on the samples are specified on the chain-of-custody.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.
