PROJECT SPECIAL PROVISIONS GEOENVIRONMENTAL

CONTAMINATED SOIL AND GROUNDWATER (4/4/2023)

The Contractor's attention is directed to the fact that soil and groundwater contaminated with petroleum hydrocarbon compounds exist within the project area. The known areas of contamination are indicated on corresponding plans sheets. Information relating to these contaminated areas, sample locations, and investigation reports will be available at the following web address by navigating to the correct letting year and month then selecting, "Plans and Proposals", "I-5972", "Individual Sheets/520 GeoEnvironmental":

http://dotw-xfer01.dot.state.nc.us/dsplan/

Petroleum contaminated soil may be encountered during any earthwork activities on the project. The Contractor shall only excavate those soils that the Engineer designates necessary to complete a particular task. The Engineer shall determine if soil is contaminated based on petroleum odors and unusual soil staining. Contaminated soil not required to be excavated is to remain in place and undisturbed. Undisturbed soil shall remain in place, whether contaminated or not. The Contractor shall transport all contaminated soil excavated from the project to a facility licensed to accept contaminated soil.

In the event that a stockpile is needed, the stockpile shall be created within the property boundaries of the source material and in accordance with the Diagram for Temporary Containment and Treatment of Petroleum-Contaminated Soil per North Carolina Department of Environmental Quality's Division of Waste Management UST Section GUIDELINES FOR EX SITU PETROLEUM CONTAMINATED SOIL REMEDIATION. If the volume of contaminated material exceeds available space on site, the Contractor shall obtain a permit from the NCDEQ UST Section's Regional Office for off-site temporary storage. The Contractor shall provide copies of disposal manifests completed per the disposal facilities requirements and weigh tickets to the Engineer.

If groundwater is encountered and dewatering is required in areas of known contamination, then the contractor shall containerize the groundwater in vessels provided by the Department. The Department will be responsible for the sampling and disposal of the water. Handling contaminated ground water will be incidental to the project.

Measurement and Payment:

The quantity of contaminated soil hauled and disposed of shall be the actual number of tons of material, which has been acceptably transported and weighed with certified scales as documented by disposal manifests and weigh tickets. The quantity of contaminated soil, measured as provided above, shall be paid for at the contract unit price per ton for "Hauling and Disposal of Petroleum Contaminated Soil".

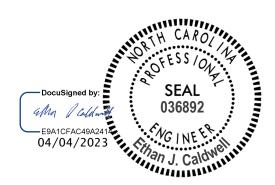

The above price and payment shall be full compensation for all work covered by this section, including, but not limited to stockpiling, loading, transportation, weighing, laboratory testing, disposal, equipment, decontamination of equipment, labor, and personal protective equipment.

Payment shall be made under:

Pay Item

Hauling and Disposal of Petroleum Contaminated Soil

Pay Unit Ton

Dear Mr. Haden:

Duncklee & Dunham, P.C. (Duncklee & Dunham) is pleased to submit this *Preliminary Site Assessment Report* for the referenced site. The objective of our services was to assist the North Carolina Department of Transportation (NCDOT) – Geotechnical Engineering Unit with identifying potential environmental concerns within the rights-of-way and/or easements of the above-referenced site. This work is consistent with the NCDOT's Request for Technical and Cost Proposal dated June 7, 2019 and our *Revised Technical and Cost Proposal* dated June 19, 2019. Based on the findings from this work, Duncklee & Dunham recommends submitting this report to the Raleigh Regional Office of the North Carolina Department of Environmental Quality.

1 Introduction

Duncklee & Dunham, P.C. (Duncklee & Dunham) conducted a Preliminary Site Assessment of the referenced site in the southeast quadrant at the intersection of U.S. Highway 70 Business (East Market Street) and the I-95 North exit Ramp, east of Smithfield in Johnston County, North Carolina (Figures 1 and 2). The North Carolina Department of Transportation (NCDOT) plans to make changes to the I-95 North exit ramp at East Market Street. Our work is consistent with the NCDOT's *Request for Technical and Cost Proposal* dated June 7, 2019, and our *Revised Technical and Cost Proposal* dated June 19, 2019. The objective of our services was to assist NCDOT – Geotechnical Engineering Unit with identifying potential environmental concerns within the rights-of-way and/or easements of the above-referenced site. Our services included a geophysical survey to identify subsurface metallic features such as underground storage tank (UST) systems, and the advancement of 11 borings to test for the presence of contaminants in the areas where the new roadway will be constructed, along rights-of-way for NCDOT, and at new utility easements.

2 History

The NCDOT prepared a GeoEnvironmental Phase I Report dated December 6, 2018, that identified the site as a former B&S Texaco gasoline station, now a vacant parcel. NCDOT determined that six USTs were reported to have been removed from the site in 1994. After review of the incident list of the UST Section of the North Carolina Department of Environment and Natural Resources (NCDENR, now the North Carolina Department of Environmental Quality – NCDEQ), the NCDOT determined NCDENR closed a leaking UST incident file for the site in 2012.

3 Methods

Duncklee & Dunham called NC811 on July 17, 2019 and requested utilities to be marked in the areas of investigation. NC811 notified Johnston County Public Utilities, Duke Energy, CenturyLink, Conterra Ultra Broadband, Time Warner Cable-Charter, and the Town of Smithfield. The clearance was valid through August 7, 2019. Duncklee & Dunham notified the property owner of when we would conduct field work at the site and then again before the field work began.

Page 2 of 5

Duncklee & Dunham reviewed regulatory records on NCDEQ's Laserfiche website and found documentation of a leaking UST system (Incident No. 11797) that was discovered on the site in 1993. NCDENR classified the site as low-risk and closed the incident file in 2012 with a Notice of Residual Petroleum because contaminants in groundwater were at concentrations that exceeded the North Carolina groundwater quality standards promulgated in Title 15A, Subchapter 2L, Section .0202 of the North Carolina Administrative Code (15A NCAC 2L .0202; the "2L standards"). The last groundwater monitoring report on Laserfiche was prepared by Science Applications International Corporation (SAIC) in 2008. This report showed contaminated groundwater beneath a majority of the site. SAIC recommended the installation of an additional well to delineate the southern extent of contaminant plume in groundwater but we did not find records in the file that the southern extent of the plume had been delineated. SAIC abandoned the monitoring wells at the site in 2011. We observed the former locations of some of these monitoring wells during our field work.

The last soil assessment report on Laserfiche was prepared by SAIC in 2006, in which they collected 18 soil samples in a gridded pattern throughout the site. A majority of these samples exhibited petroleum constituents at concentrations that exceeded the Soil to Water Maximum Soil Contaminant Concentrations, even in the samples collected where the UST system had not been located.

Duncklee & Dunham contacted Johnston County Emergency Management to inquire about additional records of releases and did not find such records.

3.1 Geophysics

Pyramid Geophysical Services (Pyramid), under contract to Duncklee & Dunham, conducted a geophysical survey at the site on July 22, 2019. Pyramid used a Geonics EM61 MK2® metal detector with an integrated Geode External GPS/GLONASS receiver to locate buried metal objects, and then used a Geophysical Survey Systems, Inc. SIR 4000 GPR instrument with a 350-megahertz antenna to image selected anomalies.

3.2 Soil Borings

Troxler Geologic Services, Inc. (Troxler), under contract to Duncklee & Dunham, used a Geoprobe® equipped with direct-push technology to advance 11 soil borings, nos. B-1 through B-11 (Photograph No. 1, Appendix A) on July 26, 2019. As shown on Figure 2, Troxler advanced B-1, -4, -5, -6, -8, and -11 along the proposed NCDOT right of way and control access line (Photograph No. 2), B-2 near the proposed slope stake cut line, B-3 near the former location of a dispensing island (Photograph No. 3), B-7 near the proposed drainage outlet in the southwestern corner of the site (Photograph No. 4), and B-9 and -10 near the proposed drainage outlet near the northwestern corner of the subject site (Photograph No. 5). We observed up to 8 inches of standing water in the area west of borings B-3 and -4 and between B-3 and -4, thus limiting our boring locations.

Page 3 of 5

The boring depths and depths to water below land surface (bls) for each boring are shown in the following table:

Boring	Boring Depth	Depth to Water
ID	(feet bls)	(feet bls)
B-1	8.0	5.5
B-2	8.0	5.0
B-3	8.0	5.87
B-4	4.0	2.0
B-5	12.0	8.5
B-6	8.0	7.5
B-7	8.0	6.5
B-8	6.5	2.0
B-9	4.0	3.0
B-10	4.0	2.0
B-11	8.0	7.5

Duncklee & Dunham used a Trimble Geo $7x^{\otimes}$ handheld GPS unit to determine the locations of each boring. Table 1 shows the Northings and Eastings for these borings.

Troxler collected soil samples in new acetate sleeves, each 4 feet long. A majority of the soil samples were comprised of light brown, silty sand with clay and light gray silt. Boring logs are in Appendix B. Duncklee & Dunham collected representative samples of native material at selected intervals in each soil boring and stored the samples in twin Ziploc® bags, except for B-4, which encountered the water table just below a 2-foot-thick layer of asphalt. After allowing one of the bags to sit untouched in the sun and the other in a cooler for approximately 15 minutes, we used a photoionization detector (PID) to screen the headspace in each bag left in the sun for volatile organic compounds (VOCs). We recorded the soil-screening results in the field log. Table 2 summarizes the screening results. The soil samples collected above the water table were not stained and did not exhibit petroleum odors except for the samples from B-2 and B-3, which exhibited petroleum odors with increasing concentration from 2 to 4 feet bls. These two borings are in locations near SAIC borings that exhibited contamination. As shown on Table 2, the PID readings of the soil samples from B-2 and B-3 ranged from 6.4 to 142 parts per million (ppm) in B-2 and 32.2 to 97.9 ppm in B-3. The PID readings of the remaining samples did not exceed 0.2 ppm, and we did not detect a petroleum odor in these samples.

Duncklee & Dunham collected a soil sample from each boring except B-4 to be tested in the laboratory. We placed the soil samples from the Ziploc® bags from the cooler into laboratory-supplied containers, placed the containers in a cooler with ice, and shipped the cooler under chain-of-custody to RED Lab, LLC (RED Lab) in Wilmington, North Carolina. RED Lab tested the samples for total petroleum hydrocarbons (TPH)-diesel range organics (DRO) and TPH-gasoline range organics (GRO) using Ultraviolet Fluorescence methodology.

3.3 Groundwater

Troxler constructed temporary monitoring well TW-1 in boring B-3 to a depth of 10 feet bls using 1-inch diameter PVC and placed the well screen from 5 to 10 feet bls. Duncklee & Dunham purged groundwater from the well using a peristaltic pump with a new length of low-density polyethylene tubing and silicon tubing for the pump head. Once the purge water appeared clear, Duncklee & Dunham sampled TW-1. We discharged groundwater directly from the peristaltic pump tubing into laboratory-supplied containers, placed the containers in a cooler with ice, and delivered the cooler under chain-of-custody to Environmental Conservation Laboratories (ENCO) in Cary, North Carolina. ENCO laboratory tested the groundwater samples for VOCs according to EPA Method 8260D and semivolatile organic compounds according to EPA Method 8270E. In accordance with NCDEQ guidance, Duncklee & Dunham discharged the purge water on the ground around TW-1 once we had collected the groundwater sample. Troxler abandoned TW-1 by filling the borehole with bentonite pellets in accordance with well abandonment procedures promogulated in Title 15A, Subchapter 2C, Section .0113 of the North Carolina Administrative Code (15A NCAC 2C .0113).

4 Results

4.1 Geophysics

Pyramid's *Geophysical Survey* report, dated August 5, 2019, is in Appendix C. Pyramid identified 11 electromagnetic anomalies that they attributed to visible cultural features on the ground surface or buried, metallic debris and/or utilities. The ground penetrating radar survey confirmed three of the electromagnetic anomalies were associated with unknown buried metallic features. Pyramid did not identify anomalies indicative of abandoned USTs or buried metal drums.

4.2 Soil Borings

Table 2 and Figure 3 summarize the laboratory results for the soil samples collected from each soil boring. The laboratory reports are in Appendix D. RED Lab detected TPH-GRO and/or -DRO in each of the soil samples, except for the samples from B-9 and B-11. RED Lab did not detect TPH at concentrations that exceeded NCDEQ's action levels of 100 mg/kg for TPH-GRO or 50 mg/kg for TPH-DRO except in the sample collected from B-2. RED Lab detected TPH-GRO at a concentration of 65.7 mg/kg in B-2. RED Lab identified the hydrocarbon fingerprint of the TPH-DRO in B-2 as "degraded gas."

4.3 Groundwater

Table 3 and Figure 3 summarize the laboratory results for the sample collected from TW-1. ENCO detected 17 petroleum constituents in this groundwater sample; the concentrations of 14 analytes exceeded the respective 2L Standards. The concentrations did not exceed the respective Gross Contamination Levels.

Page 5 of 5

5 Conclusions

5.1 Geophysics

Pyramid identified 11 magnetic anomalies on the site that they attributed to cultural features on the ground surface or buried, metallic debris and/or utilities. Pyramid did not identify anomalies indicative of abandoned USTs or buried metal drums.

5.2 Soil Samples

The soil sample from B-2 exhibited TPH-GRO at a concentration that exceeded NCDEQ's action level. The extent of contamination shown in Figure 3 reflects what we estimate is 100 cubic yards of contaminated soil above the water table based on the data collected during our assessment. However, SAIC reported soil contamination throughout the site during their assessment in 2006, including locations where the former UST system was not located. Duncklee & Dunham detected petroleum odors from 2 to 8 feet bls in the soil samples from B-2 and B-3, but we did not observe stains in these soil samples. Duncklee & Dunham did not detect petroleum odors or observe stains in the other soil samples collected above the water table.

5.3 Groundwater Samples

ENCO detected 14 analytes at concentrations that exceeded the respective 2L Standards in the groundwater sample collected from TW-1. Most of the exceedances were VOCs, which suggests that a majority of the contaminants were derived from a low boiling point fuel such as gasoline that had been stored in the USTs formerly at the site. The estimated extent of contamination is shown on Figure 3. The bounds of the plume reflect the extent of groundwater contamination from the data collected during this assessment. However, the SAIC's 2008 Groundwater Monitoring Report shows groundwater contamination beneath a majority of the subject site. Figure 3 shows the extent of the plume shown in SAIC's monitoring report.

6 Recommendations

Duncklee & Dunham recommends submitting this report to the Raleigh Regional Office of the NCDEQ.

UST	Underground Storage Tank

Project Description: Pyramid Environmental conducted a geophysical investigation for Duncklee & Dunham at Parcel 3 located at the Southeast Quadrant of East Market Street and the I-95 North Exit Ramp in Smithfield, NC. The survey was part of an NCDOT Right-of-Way (ROW) investigation (NCDOT Project I-5972). The survey was designed to extend from the existing edge of pavement into the proposed ROW and/or easements, whichever distance was greater. Conducted on July 22, 2019, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

Geophysical Results: The geophysical investigation consisted of electromagnetic (EM) induction-metal detection and ground penetrating radar (GPR) surveys. A total of eleven EM anomalies were identified. The majority of the EM responses were directly attributed to visible cultural features. Three locations containing minor unknown buried metal were investigated with GPR. GPR identified the presence of potential minor buried metallic debris at the site. No evidence of larger structures such as USTs was observed. Collectively, the geophysical data did not record any evidence of unknown metallic USTs at Parcel 3.

INTRODUCTION

Pyramid Environmental conducted a geophysical investigation for Duncklee & Dunham at

Parcel 3 located at the Southeast Quadrant of East Market Street and the I-95 North Exit

Ramp in Smithfield, NC. The survey was part of an NCDOT Right-of-Way (ROW)

investigation (NCDOT Project I-5972). The survey was designed to extend from the

existing edge of pavement into the proposed ROW and/or easements, whichever distance

was greater. Conducted on July 22, 2019, the geophysical investigation was performed to

determine if unknown, metallic underground storage tanks (USTs) were present beneath

the survey area.

The site included one lot consisting of grass, asphalt, and concrete surfaces. An aerial

photograph showing the survey area boundaries and ground-level photographs are shown

in Figure 1.

FIELD METHODOLOGY

The geophysical investigation consisted of electromagnetic (EM) induction-metal

detection and ground penetrating radar (GPR) surveys. Pyramid collected the EM data

using a Geonics EM61-MK2 (EM61) metal detector integrated with a Geode External

GPS/GLONASS receiver. The integrated GPS system allows the location of the instrument

to be recorded in real-time during data collection, resulting in an EM data set that is geo-

referenced and can be overlain on aerial photographs and CADD drawings. A boundary

grid was established around the perimeter of the site with marks every 10 feet to maintain

orientation of the instrument throughout the survey and assure complete coverage of the

area.

According to the instrument specifications, the EM61 can detect a metal drum down to a

maximum depth of approximately 8 feet. Smaller objects (1-foot or less in size) can be

detected to a maximum depth of 4 to 5 feet. The EM61 data were digitally collected at

approximately 0.8-foot intervals along north-south trending or east-west trending,

2 | Page

Parcel 3 - Southeast Quadrant of East Market Street and the

I-95 North Exit Ramp (NCDOT Project I-5972)

Smithfield, North Carolina

generally parallel survey lines, spaced five feet apart. The data were downloaded to a computer and reviewed in the field and office using the Geonics NAV61 and Surfer for Windows Version 15.0 software programs.

GPR data were acquired across select EM anomalies on July 22, 2019, using a Geophysical Survey Systems, Inc. (GSSI) SIR 4000 controller using a 350 MHz HS antenna. Data were collected both in reconnaissance fashion as well as along formal transect lines across EM features. The GPR data were viewed in real-time using a vertical scan of 512 samples, at a rate of 48 scans per second. GPR data were viewed down to a maximum depth of approximately 6 feet, based on dielectric constants calculated by the DF unit in the field during the reconnaissance scans. GPR transects across specific anomalies were saved to the hard drive of the DF unit for post-processing and figure generation.

Pyramid's classifications of USTs for the purposes of this report are based directly on the geophysical UST ratings provided by the NCDOT. These ratings are as follows:

Geophysical Surveys for Underground Storage Tanks on NCDOT Projects									
High Confidence Known UST	Intermediate Confidence Probable UST	Low Confidence Possible UST	No Confidence Anomaly noted but not						
Active tank - spatial location, orientation, and approximate depth determined by geophysics.	Sufficient geophysical data from both magnetic and radar surveys that is characteristic of a tank. Interpretation may be supported by physical evidence such as fill/vent pipe, metal cover plate, asphalt/concrete patch, etc.	Sufficient geophysical data from either magnetic or radar surveys that is characteristic of a tank. Additional data is not sufficient enough to confirm or deny the presence of a UST.	characteristic of a UST. Should be noted in the text and may be called out in the figures at the geophysicist's discretion.						

DISCUSSION OF RESULTS

Discussion of EM Results

A contour plot of the EM61 results obtained across the survey area at the property is presented in **Figure 2**. Each EM anomaly is numbered for reference in the figure. The following table presents the list of EM anomalies and the cause of the metallic response, if known:

LIST OF METALLIC ANOMALIES IDENTIFIED BY EM SURVEY

Metallic Anomaly #	Cause of Anomaly	Investigated with GPR
1	Signs	
2	Suspected Buried Metallic Debris	✓
3	Utility	
4	Reinforced Concrete Pipe	
5	Utilities	
6	Suspected Buried Metallic Debris	✓
7	Light	
8	Fence/Suspected Utility	
9	Suspected Buried Metallic Debris	✓
10	Reinforced Concrete Pipe	
11	Utility/Fence	

The majority of the EM responses were directly attributed to visible cultural features including signs, utilities, reinforced concrete pipes, a light, and fences. GPR was performed across EM Anomalies 2, 6, and 9 to investigate for the presence of unknown buried metal.

Discussion of GPR Results

Figure 3 presents the locations of the formal GPR transects performed at the property as well as select transect images. All formal GPR transect images can be found in **Appendix A**. A total of six formal GPR transects were performed at the parcel. GPR Transects 1-6 recorded evidence of minor, discrete hyperbolic reflectors consistent with buried metallic debris. No evidence of larger structures such as USTs was observed.

Collectively, the geophysical data <u>did not record any evidence of unknown metallic USTs</u> <u>at Parcel 3</u>. **Figure 4** provides an overlay of the metal detection results on the NCDOT MicroStation engineering plans for reference.

SUMMARY & CONCLUSIONS

Pyramid's evaluation of the EM61 and GPR data collected at Parcel 3 in Smithfield, North Carolina, provides the following summary and conclusions:

- The EM61 and GPR surveys provided reliable results for the detection of metallic USTs within the accessible portions of the geophysical survey area.
- The majority of the EM responses were directly attributed to visible cultural features. Three locations containing minor unknown buried metal were investigated with GPR.
- GPR identified the presence of potential minor buried metallic debris at the site. No evidence of larger structures such as USTs was observed.
- Collectively, the geophysical data did not record any evidence of unknown metallic USTs at Parcel 3.

LIMITATIONS

Geophysical surveys have been performed and this report was prepared for Duncklee & Dunham in accordance with generally accepted guidelines for EM61 and GPR surveys. It is generally recognized that the results of the EM61 and GPR surveys are non-unique and may not represent actual subsurface conditions. The EM61 and GPR results obtained for this project have not conclusively determined the definitive presence or absence of metallic USTs, but the evidence collected is sufficient to result in the conclusions made in this report. Additionally, it should be understood that areas containing extensive vegetation, reinforced concrete, or other restrictions to the accessibility of the geophysical instruments could not be fully investigated.

Results generated by a QED HC-1 analyser. Concentration values in mg/kg for soil samples and mg/L for water samples. Soil values are not corrected for moisture or stone content

Fingerprints provide a tentative hydrocarbon identification. The abbreviations are:- FCM = Results calculated using Fundamental Calibration Mode: % = confidence for sample fingerprint match to library

(SBS) or (LBS) = Site Specific or Library Background Subtraction applied to result: (PFM) = Poor Fingerprint Match: (T) = Turbid: (P) = Particulate present

RE: Laboratory Results for

Project Number: 2019127, Project Name/Desc: Old Brogden Farms II Site

ENCO Workorder(s): CC12467

Dear Alec Dziwanowski,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, July 26, 2019.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Cary. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Chuck Smith

Project Manager

FLAGS/NOTES AND DEFINITIONS

- **B** The analyte was detected in the associated method blank.
- **D** The sample was analyzed at dilution.
- The reported value is between the laboratory method detection limit (MDL) and the laboratory method reporting limit (MRL), adjusted for actual sample preparation data and moisture content, where applicable.
- **U** The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
- **E** The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- MRL Method Reporting Limit. The MRL is roughly equivalent to the practical quantitation limit (PQL) and is based on the low point of the calibration curve, when applicable, sample preparation factor, dilution factor, and, in the case of soil samples, moisture content.
- **PQL** PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
- **N** The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a "tentative identification".
- **P** Greater than 25% concentration difference was observed between the primary and secondary GC column. The lower concentration is reported.
- [CALC] Calculated analyte MDL/MRL reported to the highest reporting limit of the component analyses.
- **QL-02** The associated laboratory control sample exhibited high bias; since the result is ND, there is no impact.
- **QM-07** The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- **QM-11** Precision between duplicate matrix spikes of the same sample was outside acceptance limits.
- **QV-01** The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.
- **QV-02** The associated continuing calibration verification standard exhibited low bias; the reported result should be considered to be a minimum estimate.

FROM: Craig Haden

GeoEnvironmental Project Manager

Craig Haden

GeoEnvironmental Section Geotechnical Engineering Unit

TIP NO: I-5972 WBS: 44989.1.1 COUNTY: JOHNSTON

DIVISION 4

DESCRIPTION: I-95 at US 70 Business

SUBJECT: GeoEnvironmental Phase I Report

The GeoEnvironmental Section of the Geotechnical Engineering Unit performed a Phase I field investigation on December 5, 2018 for the above referenced project to identify geoenvironmental sites of concern. The purpose of this report is to document sites of concern within the project study area that are or may be contaminated. These sites of concern should be included in the environmental planning document in an effort to assist the project stakeholders in reducing or avoiding impacts to these sites. Sites of concern may include, but are not limited to, underground storage tank (UST) sites, dry cleaning facilities, hazardous waste sites, regulated landfills and unregulated dumpsites.

Findings

Six (6) sites of concern were identified within the proposed study area. We anticipate low monetary and scheduling impacts resulting from these sites. See the following table and figure for details.

Please note that discovery of additional sites not recorded by regulatory agencies and not reasonably discernible during the project reconnaissance may occur. The GeoEnvironmental Section should be notified immediately after discovery of such sites so their potential impact(s) may be assessed.

If there are questions regarding the geoenvironmental issues, please contact me, at (919) 707-6871.

(01) Property Name: Speedway # 6960

1669 E. Market St Smithfield, NC 27577

Facility ID: 00-0-000036566 Incident Type/Number: N/A **Property Owner:**

Wilcohess LLC 539 S. Main St Findlay, OH 45840

UST Owner:

Speedway LLC 500 Speedway Dr Enon, OH 45323

Anticipated Impacts: Low

This site currently operates as a convenience store/gas station. It is located on the northwest quadrant of E. Market St and Outlet Center Dr. According to the UST section registry there are three (3) USTs currently in use. No monitoring wells were observed during the site investigation.

(02) Property Name:

Sheetz # 511 1700 E. Market St Smithfield, NC 27577

Facility ID: 00-0-000038092 Incident Type/Number: N/A **Property Owner:**

PTM LP 5700 Sixth Ave Altoona, PA 16602

UST Owner:

Sheetz Inc 5700 Sixth Ave Altoona, PA 16602

Anticipated Impacts: Low

This Site Currently operates as a convenience store/gas station. It is located on the southeast quadrant of E. Market St (US 70 Bus) and Towne Centre Pl. According to the UST section registry there are four (4) USTs currently in use. No monitoring wells were observed during the site investigation.

(03) Property Name:

Panera Bread 1716 E. Market St Smithfield, NC 27577

Facility ID: 00-0-0000023565

Incident Type/Number: 23206, 42077

Property Owner:

Smith NC POOH, LLC 101 W 55th St New York, NY 10019

UST Owner:

Sunoco Inc

3801 West ChesterPike Newtown Square, PA 19073

Anticipated Impacts: Low

This site is currently a Panera Bread Restaurant, there is also an Arby's Restaurant on the adjoining parcel. It is the former location of Sunoco # 0614-3788. It is located on the southwest quadrant of E. Market St (US 70 Bus) and the I-95 south bound on Ramp. According to the UST section registry six (6) USTs were removed in August 2017. The site has since been redeveloped as the Panera Bread and Arby's restaurants. Incident #'s 23206 and 42077 are associated with the former facility (Incident #'s are for the same incident) and were closed out in 2002. No monitoring wells were observed during the site investigation

(04) Property Name:

Vacant Lot (B&S Texaco) SE Quadrant E. Market (US 70 Bus) and I-95 exit ramp Smithfield, NC 27577

Facility ID: 00-0-000030057 Incident Type/Number: 11797

Property Owner:

Old Brogden Farms II, LLC 6317 Bayswater Trl Raleigh, NC 27612

UST Owner:

Tommy Jarrett PO Drawer 8

Goldsboro, NC 27533

Anticipated Impacts: Low

This site is currently a vacant lot. It is located on the south side of E. Market St (US 70 Bus) at the I-95 north bound exit. It is the former location of B&S Texaco. According to the UST section registry six (6) USTs were removed in 1994. Incident # 11797 is associated with this facility and was closed out in 2012. The property was fenced off during the site investigation. One (1) abandoned monitoring well was observed on the outside of the fence on the service Rd.

(05) Property Name:

Trisha's Café 911 Mallard Rd Smithfield, NC 27577

Facility ID: 00-0-000014912 Incident Type/Number: 10973 **Property Owner:**

Mark Ryan PO Box 2458 Smithfield, NC 27577

UST Owner:

Fitchett Investments, Inc

PO Box 1407 Dunn, NC 28334

Anticipated Impacts: Low

This site appeared to be vacant at the time of the site investigation. It is located on the east side of Mallard Rd approximately 370 feet south of the I-95 exit. It is the former location of the Sun Towel Shop. According to the UST section registry four (4) USTs were removed in 1992. Incident # 10973 is associated with this facility and was closed out in 1993. No monitoring wells were observed during the site investigation.

(06) Property Name:

Village Motor Lodge 198 Mallard Rd Smithfield, NC 27577

Facility ID: 00-0-000029939 **Incident Type/Number:** 11409

Property Owner:

Danbar Limited Partnership PO Box 1333 Smithfield, NC 27577

UST Owner:

Village Motor Lodge 198 Mallard Rd Smithfield, NC 27577

Anticipated Impacts: Low

This site currently operates as the Village Motor Lodge. It is located on the west side of Mallard Rd at the I -95 exit. According to the UST section Two (2) USTs were removed in 1993. Incident # 11409 is associated with this facility and was closed out in 2006. One (1) monitoring well was observed behind the vacant restaurant. According to the incident database this well was installed in the UST basin and no contaminants were identified.
