STATE PROJECT: 33649.1.1 (B-4312)
F.A. PROJECT: BRZ-1613 (2)
COUNTY: Warren
DESCRIPTION: Bridge No. 42 on -L- (SR 1613, Shocco Springs Rd.) over Shocco Creek at Station 20+48

SUBJECT: Geotechnical Report – Structure Inventory

Project Description

A single-span bridge, 100-feet in length with a 70° skew, is proposed at the same location on -L- (SR 1613, Shocco Springs Rd.) over Shocco Creek to replace the existing structure. The new bridge is 100 feet long and 33 feet in width, and will accommodate two travel lanes. The existing structure is 53.6 feet in length and 19 feet in width. Stone rubble from an old bridge foundation is located approximately 200 feet downstream. An offsite detour will be used during the construction of the new bridge. The project is located in Warren County outside the city limits of Warrenton.

The subsurface investigation for the structure was conducted during July 2006 using an ATV-mounted CME-45C drill machine, and in June 2007 using an ATV-mounted CME-550 drill machine. Two Standard Penetration Test borings were performed at each end bent location. All borings were advanced until crystalline rock was encountered. Representative soil samples were obtained for visual classification in the field and selected samples were sent to the Materials and Tests Unit for laboratory analysis.

Physiography and Geology

The project is located in the rolling terrain of the Piedmont Physiographic province. The project area is rural, with few homes located nearby. The area along Shocco Creek is wooded. Geologically, the project is located within the Raleigh Belt and is underlain by biotite gneiss and mica schist.

Soil Properties

Soils encountered at the project site include roadway embankment, alluvial and residual soils.

Roadway embankment from the existing alignment was encountered in all borings. Embankment soils are 6.0 feet thick, and are composed of red-orange and brown, very soft to soft, moist, silty clay (A-7-6).

Alluvial soils were encountered in all boring locations. The alluvial soils range from 10.5 to 13.5 feet in thickness. These soils mainly consist of blue-gray, very soft to stiff, moist to wet, sandy silt (A-4), and blue-

gray, and gray, very soft to medium stiff, moist, sandy clay (A-6) and silty clay (A-7-5). Blue-gray, medium dense, wet, silty sand (A-2-4) was also encountered. The alluvial soils were deposited on residual soil.

Residual soils were encountered at all boring locations and range from 1.6 to 3.3 feet in thickness. The residual soils consist of orange-tan and gray, medium dense, moist to wet, silty sand (A-2-4), and brown, stiff, sandy silt (A-4). The residual soils are underlain by weathered rock (Mica schist).

Rock Properties

Weathered rock was derived from the underlying bedrock of mica schist. The weathered rock ranges in thickness from 0.6 to 3.7 feet. Weathered rock was encountered in all borings. The top of weathered rock ranges in elevation from 227.0 feet at EB1-B to 231.7 feet at EB1-A.

Crystalline rock was encountered at each boring location. The top of crystalline rock ranges in elevation from 224.1 feet at EB1-B, to 228.0 feet at EB1-A. Crystalline rock at consists of mica schist.

Groundwater

Groundwater was present in all borings. The groundwater elevations range from 240.4 feet at EB2-B to 241.7 feet at EB1-A. Surface water in Shocco Creek was measured at elevation 241.2 feet from the field survey on the Hydraulic Report dated March 2006.

Notice

This Geotechnical foundation report is based on the Bridge Survey and Hydraulic Report for Shocco Creek dated June 14, 2006 and the Preliminary General Drawing dated July 17, 2006. If significant changes are made in the design or location of the proposed structure, the subsurface information should be reviewed and modified as necessary.

FIELD SCOUR REPORT

WBS: 33649.1.1 TIP: B-4312 COUNTY: WARREN

DESCRIPTION(1): BRIDGE NO. 42 ON -L- (SR 1613, SHOCCO SPRINGS RD.) OVER SHOCCO CREEK

EXISTING BRIDGE

Information from: Field Inspection X Microfilm _____ (reel _____ pos: _____)
 Other (explain) _____

Bridge No.: 42 Length: 53.6' Total Bents: 4 Bents in Channel: 2 Bents in Floodplain: 2
 Foundation Type: TIMBER PILES

EVIDENCE OF SCOUR(2)

Abutments or End Bent Slopes: LARGE (4'X10') SCOUR PIT ON END BENT ONE SLOPE.
SMALL (2'X3') SCOUR PIT ON UPSTREAM SIDE OF END BENT TWO.

Interior Bents: MODERATE SCOUR. RIP-RAP PLACED AROUND ALL PILES.

Channel Bed: NONE.

Channel Bank: NONE

EXISTING SCOUR PROTECTION

Type(3): RIP-RAP

Extent(4): SURROUNDING INTERIOR BENT PILES, SOME ON END BENT SLOPES

Effectiveness(5): EFFECTIVE

Obstructions(6): NONE

INSTRUCTIONS

- 1 Describe the specific site's location, including route number and body of water crossed.
- 2 Note scour evidence at existing end bents or abutments (e.g. undermining, sloughing, degradations).
- 3 Note existing scour protection (e.g. rip rap).
- 4 Describe extent of existing scour protection.
- 5 Describe whether or not the scour protection appears to be working.
- 6 Note obstructions such as dams, fallen trees, debris at bents, etc.
- 7 Describe the channel bed material based on observation and/or samples. Include any lab results with report.
- 8 Describe the channel bank material based on observation and/or samples. Include any lab results with report.
- 9 Describe the material covering the banks (e.g. grass, trees, rip rap, none).
- 10 Determine the approximate floodplain width from field observation or a topographic map.
- 11 Describe the material covering the floodplain (e.g. grass, trees, crops).
- 12 Use professional judgement to specify if the stream is degrading, aggrading, or static.
- 13 Describe potential and direction of the stream to migrate laterally during the bridge's life (approx. 100 years).
- 14 Give the design scour elevation (DSE) expected over the life of the bridge (approx. 100 years). This elevation can be given as a range across the site, or for each bent. Discuss the relationship between the Hydraulics Unit theoretical scour and the DSE. If the DSE is dependent on scour counter measures, explain (e.g. rip rap armoring on slopes). The DSE is based on the erodability of materials, giving consideration to the influence of joints, foliation, bedding characteristics, % core recovery, % RQD, differential weathering, shear strength, observations at existing structures, other tests deemed appropriate, and overall geologic conditions at the site.

EB1	EB2										
226.6	227.8										

Comparison of DSE to Hydraulics Unit theoretical scour:
 The DSE ranges between 226.6 and 227.8 feet across the site, compared to the Hydraulic Units Theoretical Scour Elevation of 224.8 feet for the 100 year event.
