H&H Project ROW-148**

1.0 Introduction

Hart & Hickman, PC (H&H) has prepared this Preliminary Site Assessment (PSA) documenting assessment activities performed at the Rebecca Younce property (NC DOT Parcel #35) located at 396 East King Street (US Highway 421) in Boone, Watauga County, North Carolina. This assessment was conducted on behalf of the North Carolina Department of Transportation (NC DOT) in accordance with the scope of work outlined in our February 29, 2008 proposal.

The purpose of this assessment was to determine the presence or absence of impacted soil at the subject property in the proposed construction areas related to the widening of US Highway 421 (State Project U-4020). A site location map is included as Figure 1 and a site map is presented as Figure 2. The NC DOT preliminary plan of the US Highway 421 widening area near the Rebecca Younce property is included in Appendix A.

Due to the size of the proposed right of way relative to the size of the parcel, NCDOT indicated that this site will most likely be a total take. Therefore, the soil assessment was not limited to the area within the proposed right of way. Soil assessment was performed on the entire property where potential soil impacts would be most likely to occur.

The Rebecca Younce property is currently an active dry cleaning facility (High Country Cleaners). According to an Environmental Data Resources (EDR) report for the site vicinity, the property does not appear on the North Carolina Underground Storage Tank (UST) Section database. However, H&H observed a fill port on the southern side of the site facility indicating a UST is currently located on-site. According to the property owner, Mr. Younce, the UST was used for heating oil and is no longer in use. In addition, according to the EDR report, the Rebecca Younce property did not appear on the North Carolina Drycleaning Solvent Cleanup Program database.

2.0 Site Assessment

Soil Assessment Field Activities

H&H mobilized to the Rebecca Younce property on April 1 and April 9, 2008 to advance seven soil borings (35-1 through 35-7) by direct push technology (DPT). Prior to advancing the soil borings, H&H reviewed a Geophysical survey performed by URS Corporation (URS) between March 18 and March 22, 2008. URS utilized ground penetrating radar (GPR) and time domain electromagnetic (TDEM) technology to identify potential geophysical anomalies and potential USTs at the site. The URS results verified the UST location mentioned above and also indicated no other magnetic anomalies on the property. This UST is likely close to 550-gallons in size. URS's report, including a site map depicting the results of the GPR and TDEM, is included in Appendix B.

Prior to conducting soil borings, utilities were marked by NC One Call and by DOT's contractor Vaughn and Melton. Borings were also cleared to a five foot depth by hand auger. H&H utilized Geologic Exploration, Inc. of Statesville, North Carolina, an NC DOT approved subcontractor, to advance soil borings 35-1 through 35-7 by DPT (see Figure 2). To facilitate the selection of soil samples for laboratory analysis, soil from each boring was screened continuously for the presence of volatile organic compounds (VOCs) with an organic vapor analyzer (OVA). Additionally, H&H observed the soil for visual and olfactory indications of petroleum impacts. In general, soil samples that exhibited the highest reading on the OVA were selected for laboratory analysis. Soil boring logs are included in Appendix C.

H&H attempted to three additional soil boring locations inside the dry cleaning facility including two adjacent to the dry cleaning machine. The store is built on two slabs separated by a foam layer. The DPT hammer was unable to push through 2 the lower concrete layer. Dry cleaning machines are common sources of soil impacts.

H&H submitted seven soil samples (35-1 @ 10-12 ft; 35-2 @ 6-8 ft; 35-3 @ 6-8 ft; 35-4 @ 6-8 ft; 35-5 @ 10-12 ft; 35-6 @ 7-10 ft; and 35-7 @ 7-10 ft) for laboratory analysis. Soil samples are identified by the NC DOT Parcel number, soil boring, and the depth interval in ft. Samples were sent to Prism Laboratories Inc. (Prism) of Charlotte, North Carolina under standard chain-of-custody procedures for analysis. Samples were analyzed for volatile organic compounds (VOCs)

by EPA Method 8260B and polynuclear aromatic hydrocarbons (PAHs) by EPA Method 8270C. In addition, soil samples 35-1 (10-12 ft) and 35-3 (6-8 ft) located in the vicinity of the heating oil UST were analyzed for total petroleum hydrocarbons (TPH) gasoline-range organics (GRO) and diesel-range organics (DRO) by EPA Method 8015B. Laboratory analytical data sheets for the Parcel 35 soil samples and chain-of-custody documentation for this site are provided in Appendix D. The chain-of-custody form includes samples collected from other nearby parcels. The analytical results are discussed below.

3.0 Analytical Results

Target analytes were detected in soil samples collected from Parcel 35. Tetrachloroethylene (PCE) was detected in samples 35-5 (10-12 ft) and 35-6 (7-10 ft). PCE is a commonly used solvent in dry cleaning operations. PCE was detected at concentrations above the NC DENR soil to ground water Maximum Soil Contaminant Concentration of 0.0074 mg/kg. No PAHs were detected in the samples analyzed. No concentrations of TPH GRO and DRO were detected above NC DENR action levels in samples 35-1 (10-12 ft) and 35-3 (6-8 ft) collected near the UST.

Based on laboratory analytical results, low level PCE concentrations are present on Parcel 35 near the southwestern corner of the dry cleaning facility. Because of DPT refusal on the lower floor slab, soil borings could not be installed near the dry cleaning machine, but such locations are commonly impacted. Based on analytical results and the potential for impacts near the dry cleaning machine, H&H estimates that there are roughly 670 cubic yards (940 tons) of impacted soil between depths of 0 and 12 ft. H&H recommends additional soil assessment after the dry cleaner building is removed to better define the area of soil impacts.

DOT plans indicate a proposed cut of up to 4 to 5 ft and installation of drainage pipes in this area. Because this is a cut area and soil impacts likely begin near existing grade, the impacted soil will be disturbed. Impacted soil will be generated by soil grading work, drainage pipe installation, and utility work below existing grade in the southern portion of the dry cleaners. Impacted soil that is removed should be properly managed and disposed at a permitted facility.

Because the specific source of PCE impacts is unknown, H&H does not believe that the impacted soil qualifies as a listed hazardous waste. Considering the low PCE concentrations detected in samples 35-5 (10-12 ft) and 35-3 (6-8 ft), the soil impacts could likely be disposed as non-hazardous impacted soil by applying the 20 to 1 rule. However, if concentrations are higher under the dry cleaning machine, waste characterization sampling using the Toxicity Characteristic Leaching Procedure (TCLP) may be warranted.

4.0 Summary and Regulatory Considerations

H&H has reviewed geophysical survey results and collected soil samples at Parcel 35. One heating oil UST is present near the proposed DOT work area. Based on laboratory analytical results, low level PCE concentrations are present on Parcel 35 near the southwestern corner of the dry cleaning facility. The PCE concentrations exceed the NC DENR soil to ground water target level. Because of DPT refusal on the lower floor slab, soil borings could not be installed near the dry cleaning machine, but such locations are commonly impacted. Based on analytical results and the potential for impacts near the dry cleaning machine, H&H estimates that there are roughly 670 cubic yards (940 tons) of impacted soil between depths of 0 and 12 ft. H&H recommends additional soil assessment after the dry cleaner building is removed to better define the area of soil impacts. DOT plans indicate a proposed cut of up to 4 to 5 ft and installation of drainage pipes in this area. Impacted soil will be generated by soil grading work, drainage pipe installation, and utility work below existing grade in the southern portion of the dry cleaners. Impacted soil that is removed should be properly managed and disposed at a permitted facility.

Because the specific source of PCE impacts is unknown, H&H does not believe that the impacted soil qualifies as a listed hazardous waste. Considering the low PCE concentrations detected in samples 35-5 (10-12 ft) and 35-3 (6-8 ft), the soil impacts could be disposed as non-hazardous impacted soil by applying the 20 to 1 rule. However, if higher concentrations are present under the dry cleaning machine, waste characterization sampling using the Toxicity Characteristic Leaching Procedure (TCLP) may be warranted prior to soil disposal.

Although no soil impacts were identified in the soil samples collected adjacent to the heating oil UST, impacted soil may be present directly under the UST. Impacted soil that is removed should be

properly managed and disposed at a permitted facility. H&H recommends that the UST and its contents should be removed and disposed.

Subject: **Geophysical Investigation Report and UST Delineation**
NCDOT State Project U-4020, Watauga County
Parcels #30, 31, 33, 35, 37, 38
Boone, North Carolina
URS Project No. 31825704

Dear Mr. Bramblett:

In accordance with our technical and cost proposal (TCP) submitted to North Carolina Department of Transportation (NCDOT) on March 7, 2008, URS Corporation (URS) is pleased to present the findings of the geophysical investigation conducted as part of NCDOT State Project U-4020, Watauga County, WBS Element 35015.1.1. The objective of the investigation was to locate underground storage tanks (USTs) within the NCDOT right-of-way and construction easements along US 421/King Street in Boone, North Carolina. The geophysical investigation was conducted in advance of proposed widening of US 421/King Street and will be used to assist with the Preliminary Site Assessment (PSA) of individual parcels within the right-of-way and easement.

Site Description

The geophysical investigation was conducted for Hart & Hickman at Parcels #30, 31, 33, 35, 37, and 38. According to the Request for Proposal (RFP) issued by NCDOT, dated February 20, 2008, Parcels #30, 33, and 35 are expected to be total takes. Therefore, all accessible portions of these parcels were surveyed for this investigation. For Parcels #31, 37, and 38, the right-of-way and construction easements were surveyed for this investigation. These limits had been physically marked in the field by others prior to conducting the geophysical investigation. None of these parcels were abandoned at the time of the geophysical investigation. The majority of the survey areas consisted of asphalt driveways or parking lots.

Survey Methods

The geophysical investigation was conducted using primarily the electromagnetic (EM) method. The Geonics, Ltd. EM-61 MKII (EM-61) instrument was used to perform the investigation. Ground-penetrating radar (GPR) was used as a follow-up technique to the

Mr. Matt Bramblett, P.E.
Hart & Hickman
March 31, 2008
Page 2

EM-61 survey. The GPR survey was completed using a Sensors & Software, Inc. Noggin PLUS Smart Cart System with a 250 MHz scanning antenna.

Electromagnetic Surveying with the EM-61 MKII (EM-61)

The EM-61 is a time domain EM instrument specifically designed to detect buried metal objects. The EM-61 generates rapid EM pulses through a transmitter coil. These pulses induce secondary EM fields in the near subsurface. The secondary EM fields induced from moderately conductive subsurface materials (i.e. soil and rock) are of relatively short duration. However, the secondary EM fields induced from metallic objects, such as reinforced concrete or steel drums, are of relatively long duration. The EM-61 measures this prolonged response from metallic objects after the EM response from conductive earth materials dissipates. This design provides high resolution of metallic targets. The depth of investigation of the instrument is relatively unaffected by site specific subsurface conditions.

The EM-61 measures the EM response in millivolts (mV). The variations in EM response readings from some background level are more diagnostic than the absolute values. EM response values can be plotted and contoured to evaluate the variations across the site. Variations in the EM response resulting from buried metallic objects such as cast iron pipes are generally manifested by relatively large amplitude (greater than about 50 mV) anomalies.

The response amplitude for a given buried metallic object is primarily a function of burial depth and size of the object. It is thus useful to have some means of interpreting the depth of a given object. The EM-61 uses a two receiver coil system consisting of a top coil and a bottom coil. This design facilitates the recognition of near-surface objects from deeper targets. The EM-61 record includes the response from the top coil, the bottom coil and the differential response between the two coils. Near surface objects, such as small pieces of scrap metal, can mask the response from larger objects, such as utility lines, drums or underground storage tanks, at deeper depths. The two-coil design of the EM-61, and differential processing, allows for this masking effect to be significantly reduced. Although the EM-61 is designed to mitigate interference from surface features, large metallic objects at the surface, such as cars, buildings, and fences can effectively saturate the EM response and mask potential buried metal objects below.

Ground Penetrating Radar (GPR)

The GPR method involves transmitting relatively high-frequency electromagnetic pulses into the subsurface using a transducer antenna, and recording the subsequent signal from reflected and refracted electromagnetic energy using a receiving antenna. The electromagnetic pulses, or radar waves are influenced by many factors in the subsurface, the most important being the dielectric constant of the soil. The dielectric constant is the ratio of the speed of light in a vacuum (0.3m/ns) to the velocity of the GPR wave, quantity squared. Therefore, changes in dielectric constant correspond to changes in electromagnetic wave propagation velocity. When the wavelength is short compared to the thickness of soil layers, which is generally

Mr. Matt Bramblett, P.E.
Hart & Hickman
March 31, 2008
Page 3

true, electromagnetic waves are reflected at the interfaces of dielectric contrast in accordance with the principles of optics.

GPR is useful in mapping and locating subsurface features and stratigraphy under a variety of conditions. The method is useful in many types of geologic, environmental, and engineering applications including: locating and mapping buried waste materials; locating and delineating metallic and nonmetallic utilities, pipes, underground storage tanks and drums; mapping geological strata, fractures, and voids; and delineating and mapping previously excavated and backfilled areas.

The effectiveness of GPR surveying at a given site is directly related to the dielectric properties of the subsurface materials. The effective depth of exploration provided by the method can be limited by subsurface materials characterized with high conductivity and dielectric constants, including clay, metal and metallic minerals, or reinforced pavement, all of which absorb radar energy instead of reflecting waves back to the surface receiver. In general, the depth of investigation at a given site is inversely proportional to frequency and the degree of feature resolution is proportional to frequency. Irregular and/or rough terrain can negatively impact the quality of GPR data.

Field Investigation

The field investigation was conducted between March 18 and 22, 2008. EM-61 data were collected along parallel profiles spaced approximately 3 feet apart across the portions of the survey areas that were accessible with the EM-61. Inaccessible areas included portions of the parcels containing parked cars, dumpsters, and landscaping features. EM-61 data were recorded at a rate of 5 readings per second, which equates to an along-profile data point spacing of less than 1 foot.

A Trimble ProXRS global positioning system (GPS) was used to record simultaneous positional data coincident with the EM-61 data. The ProXRS system provides real-time differential corrections via an Omnistar subscription service. The acquired differential GPS (DGPS) have a horizontal accuracy of approximately 3 feet. URS also used the GPS system to record the locations of relevant site features.

Prior to conducting the GPR investigation, URS performed preliminary in-field analysis of the EM-61 data to identify anomalies potentially indicative of USTs. GPR follow-up was conducted at individual point target locations identified in the EM-61 data or within the sections of the parcels that could not be accessed using the EM-61. Because GPR was used as a follow-up technique, no data sets were post-processed for purposes of this investigation.

Data Processing

Mr. Matt Bramblett, P.E.
Hart & Hickman
March 31, 2008
Page 4

The EM-61 data were pre-processed using the program DAT61 MK2, issued by Geonics Ltd. The program was used primarily to prepare the data for contouring in Surfer, issued by Golden Software. Contoured data represent EM-61 Channel 3 response data. Channel 3 data include milliVolt readings recorded at a relatively later time interval during the measured response from the secondary EM field. Thus, this channel generally records secondary field responses from depths consistent with USTs. Interference from surface or near-surface features (e.g. reinforced concrete, buried catch basin, etc.) will also be recorded by this channel, which is why the GPR follow-up survey was conducted over EM-61 anomalies that could not be readily attributed to existing site features.

Investigation Results

The results of the geophysical investigation for Parcels #30, 31, and 33 are presented as **Figure 1**. The results for Parcel #35 are presented as **Figures 2 and 3**. The results for Parcels #37 and 38 are presented as **Figures 4 and 5**, respectively.

Responses from metallic objects are represented by color-shaded contours outside the interpreted background response range. Relatively strong responses (i.e. yellow to dark red contours) generally indicate buried objects of significant metal mass or surface or near-surface features (e.g. reinforced concrete pad). Relatively muted responses (i.e. dark blue contours) generally indicate decreased metal mass or metallic objects potentially buried to greater depths. Sources of known or suspected metallic interference are identified accordingly in **Figures 1 through 5**. Anomalies consistent with EM-61 response patterns for USTs are identified in **Figures 1 through 5** with either green or magenta ellipses. These anomalies were subsequently targeted for GPR follow-up surveying.

The EM-61 anomaly annotated with the green ellipse in **Figure 1** indicates a potential UST as indicated by both the EM-61 and GPR surveys. GPR surveying across this anomaly revealed parabolic-shaped reflection patterns that are consistent with USTs. The EM-61 anomalies annotated with magenta ellipses in **Figures 1, 4, and 5** indicate that the GPR follow-up survey did not reveal the characteristic parabolic-shaped reflection patterns typically associated with USTs. However, it should be noted that USTs that may no longer be intact may not exhibit characteristic GPR reflection patterns. Therefore, intrusive investigations of the EM-61 anomalies annotated with magenta ellipses in **Figures 1, 4, and 5** may be warranted if it is necessary for completion of the PSA to have confirmation of the identity of these anomalies.

A single UST appears to be buried along the southern edge of the building situated at Parcel #35. The EM-61 results in **Figure 2** indicate high-amplitude responses consistent with the presence of a UST. Follow-up GPR surveying also revealed the presence of parabolic-shaped reflection patterns associated with USTs. A fill port is situated within the center of the geophysical anomaly. The GPR antenna was used to identify the perimeter of the UST.

Mr. Matt Bramblett, P.E.
Hart & Hickman
March 31, 2008
Page 5

Figure 3 presents a photo of the field markings that indicate the interpreted UST perimeter at Parcel #35.

In general, sections of the parcels that are represented by the interpreted background range of colors in the EM-61 results appear to be free of buried metal to depths within the survey capabilities of the instrument. The results presented in **Figures 1 through 5** do not constitute an underground utility avoidance survey and therefore should be used in conjunction with proper utility marking protocol prior to beginning any intrusive work at these parcels.

Limitations

This geophysical investigation was conducted in accordance with reasonable and accepted engineering geophysics practices, and the interpretations and conclusions are rendered in a manner consistent with other consultants in our profession. All geophysical techniques have some level of uncertainty and limitations. No other representations of the reported information is expressed or implied, and no warranty or guarantee is included or intended.

We greatly appreciate the opportunity to work with you on this project. We will transmit AutoCAD files (.DXF type) of the geophysical results in a separate submittal. Please contact Matt Barner at (704) 716-0737 if you have any questions regarding this report.

Very truly yours,

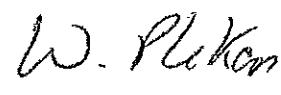

URS Corporation – North Carolina

919-847-4241(p) 919-847-4261(f)

BORING NUMBER 35-7

PROJECT: Boone PSAs

JOB NUMBER: ROW-148

LOCATION: Boone, NC

DRILLING CONTRACTOR: Geologic Exploration
DRILL RIG/ METHOD: Geopobe 6620DT
SAMPLING METHOD: DPT Sleeves
LOGGED BY M. Falknor
DRAWN BY:

BORING STARTED 4/9/08
BORING COMPLETED: 4/9/08
TOTAL DEPTH: 12
SURFACE ELEV:
DEPTH TO WATER:

Remarks:

Borehole hand-augered to 5 feet. Soil sample collected from 7-10 feet for laboratory analysis.

Appendix D
Laboratory Analytical Report

NC Certification No. 402
SC Certification No. 99012
NC Drinking Water Cert. No. 37735

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limits only. No J-flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limit only. No J-Flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

A handwritten signature in black ink, appearing to read "Angela D. Overcash".

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limits only. No J-flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limit only. No J-Flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limits only. No J-flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

Surrogate	% Recovery	Control Limits
Terphenyl-d14	109	41 - 136
Nitrobenzene-d5	89	14 - 103
2-Fluorobiphenyl	109 #	21 - 108

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limit only. No J-Flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis

Sample Comment(s):

BRL = Below Reporting Limit

Values are reported down to the reporting limit only. No J-Flags applied.

The results in this report relate only to the samples submitted for analysis and meet state certification requirements other than NELAC certification except for those instances indicated in the case narrative and/or test comments.

All results are reported on a dry-weight basis
