ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING

DESCRIPTION: NC 294 Roadway Improvements

SUBJECT: Geotechnical Report – Design and Construction Recommendations

Trigon Engineering Consultants, Inc. (Trigon) has completed the authorized subsurface investigation for the above referenced project in Cherokee County, North Carolina, and we submit the following recommendations.

I. Slope and Embankment Stability

A. Cut Slope Designs

Cut slopes of 1H:1V should generally be acceptable along the proposed roadway alignment with the following discussion kept in mind. The preliminary general drawings indicate isolated cut slopes to the ditch line and through the existing roadway and/or shoulder at inclinations of 4H:1V to 8H:1V which we find to be acceptable.

Existing cut slopes along the roadway alignment, with the exception of the vertical cut slope at approximately Station 23+25, are generally at approximately 1H:1V. These cut slopes have remained generally stable since the original roadway construction, with isolated small scale wedge-shaped block failures. Our field observations of the existing cut slopes and rock strike/dip features indicate that the proposed roadway alignment is generally oriented subnormal to the regional strike of bedding, and major rock instability in the form of large-scale slab slides

is not anticipated. It should be noted that both small scale bedding and/or fracture plane slab-type and wedge-type instability are possible within cuts along the proposed roadway alignment.

Areas which are potentially most prone to slope failure include the northeastern facing slopes of the deep trench cut located from approximately Station 68+00 to Station 72+00, and the areas in the vicinity of Stations 41+50 to 42+50 where the toes of the existing 2H:1V and 3H:1V soil/rock slopes will be undercut by the proposed 1H:1V cut. In particular, the northeast facing slopes of the trench cut should be closely evaluated. Mapped bedding and facture planes in localized segments of the existing cuts projected to the area of the proposed alignment suggest the potential for slab-type and wedge-type slides. Field inspection by a qualified geologist should be performed during the blasting and excavation of these areas and field design modifications such a benched cuts or other slope stabilization measures should be implemented as needed.

B. Undercut (Soft Foundation Soils)

We recommend that 3000 cubic yards of undercut be included in the project contract as a contingency item to be used at the discretion of the Engineer for areas of soft foundation soil.

C. Embankment Slope Designs

We recommend that all embankment slopes be constructed at inclinations of 2H:1V or flatter.

D. Embankment Stabilization

1. Fabric for Soil Stabilization Under Embankments

Soft soils, near surface (within 3 feet of the existing ground surface) groundwater, and fill heights generally exceeding 10 feet are anticipated from approximately Station 52+50 to approximately Station 60+50 (excluding bridge area). In addition, soft soils where a near surface groundwater table is not expected and where fill heights are expected to not exceed 12 feet are anticipated from approximately Station 21+50 to approximately Station 23+00. These areas may require stabilization via soil stabilization fabric and/or stone stabilization.

We recommend that 3,500 square yards of fabric for soil stabilization be included in the project contract as a contingency item. This material is to be used to facilitate the construction of embankments on soft and/or saturated foundation soils.

2. Rip Rap for Soil Stabilization Under Embankments

We recommend that 7,000 tons of Class A Rip Rap be included in the project contract as a contingency item. This material is to be used to facilitate the construction of embankments on soft and/or saturated foundation soils.

Shot rock from the cut areas of the project where blasting is anticipated may be utilized as the rip rap for soil stabilization under embankments provided that it meets NCDOT gradation requirements.

II. Subgrade Stability

A. Grade point undercut

We estimate that approximately 750 cubic yards will be undercut at grade points on the project.

B. Subgrade Undercut

The following areas may contain near surface soils with greater than 10% organic content by weight and may require undercutting:

Approximately Station 78+00 to approximately Station 79+50
Approximately Station 87+00 to approximately Station 88+00

Should proofrolling reveal the need to undercut soils in those areas, the depth of undercut should be to 3 feet below the subgrade of to suitable soils, whichever is less. We recommend than 1,000 cubic yards of undercut be included in the project as a contingency item to be used at the discretion of the Engineer for areas of unsuitable subgrade soil.

C. Fabric for Soil Stabilization in Undercut of Subgrade

We recommend that 800 square yards of soil stabilization fabric be included in the project contract as a contingency item to be used at the discretion of the Engineer for areas of subgrade undercut.

III. Borrow Specifications

A. Unsuitable Unclassified Excavation

The following areas contains unclassified excavation that is most likely unsuitable and should be wasted. The approximate limits of this material are delineated on the plans and cross-sections with a single hatch (\\\\) symbol. Quantities of this material may be obtained from the plans and cross sections.

Approximately Station 77+00 to approximately Station 79+00
Approximately Station 87+00 to approximately Station 88+00

B. Select Granular Material

We recommend a contingency item of 3,000 cubic yards of Class I or Class II select granular material (from Section 265 of the 2002 Standard Specifications) to be used as backfill with fabric for soil stabilization or backfill in water as directed by the Engineer. Select granular material should be placed to a height of 3 feet above the fabric for soil stabilization.

C. Shrinkage Factor

We recommend a 20% shrinkage factor be used for earthwork calculations.

IV. Miscellaneous

A. Reduction of Unclassified Excavation

A loss of 6,000 cubic yards is estimated on the project due to clearing and grubbing of cut sections.

B. Springs

Springs were observed in the existing cuts along the roadway corridor at approximately Station 24+00 and at approximately Station 71+80.

C. Water Wells

No water wells were evident within the proposed construction area of the project.

D. Blasting

Due to the shallow rock within many of the proposed cuts along the alignment and in particular in the deep trench cut, significant quantities of rock excavation via blasting are anticipated. To minimize localized rock slope failures, controlled blasting is critical. Line drilling of selected areas to prevent overbreak in areas of the trench cut which are poorly buttressed by soil/rock separating the proposed cuts from the existing roadway, and/or cushion blasting with reduced weight/delay interval (lbs/delay) at the finished rock face should be used. Scaling of the finished slope surfaces to remove loose rock caused by overbreak should be performed. Additionally, due to the proximity of existing homes at the eastern extent of the relocated roadway, preblast inspections of the existing structures should be performed. Conservative limits on peak particle velocity near the existing structures should be established and verified by field measurements. Field adjustments should be made to ensure peak particle velocity at the existing structures is within specified limits.
