## 1.0 INTRODUCTION

The North Carolina Department of Transportation (NCDOT) is considering shifting the alignment of Klumac Road (NC SR-2541) located in Salisbury, Rowan County, North Carolina to the west of its present location. If the alignment of Klumac Road is shifted, it will be necessary for the NCDOT to acquire properties located within the new proposed right-of-way. On May 24, 2006, Solutions-IES submitted a proposal to conduct limited Preliminary Site Assessments (PSAs) for five parcels of land located within the proposed right-of-way that are of concern to the NCDOT. This report summarizes the results of field activities conducted during the PSA for a portion of the property identified by NCDOT as the Drive Shaft Shop (**Figure 1**). The right-of-way portion of this site (Study Area) is more clearly identified on **Figure 2**. The property itself is presently owned by Industrial Supply Solutions. The scope of work executed at the site was performed in general accordance with Solutions-IES proposal NC06527P dated May 24, 2006 (proposal), and was initiated based on a Notice to Proceed issued by the NCDOT Geotechnical Engineering Unit on June 20, 2006 under contract 7000007053, dated June 5, 2006.

## 2.0 BACKGROUND AND SITE DESCRIPTION

The subject property is located at 1531 South Main Street at the intersection of South Main Street (US Highway 29) and East "A" Avenue within the City Limits of Salisbury, Rowan County, North Carolina (site). According to information provided by the NCDOT, the property currently houses a small facility that manufactures driveshafts and other drivetrain components. According to field observations, the facility consists of a single-story block building and an active manufacturing facility. The surface of the site is covered with a mixture of concrete, asphalt and grass. An electrical tower is located in the southwestern portion of the site. Numerous utilities including buried sanitary and storm sewer, natural gas and water cross the site. Photographs of the Study Area at the site are presented in **Appendix A**.

Solutions-IES reviewed information documented in a variety of websites to assist in identifying potential contaminants of interest (COIs) that could impact the right-of-way or easement for each of the properties investigated. Section 6.0 provides a summary of the websites utilized in this information review. Cleaning solvents, degreasers, and petroleum-based lubricants are typically used in the driveshaft manufacturing process, and therefore there is a possibility that these constituents may have been released from this site to the subsurface in the vicinity of the proposed right-of-way. Based on this information,

Solutions-IES selected analytical parameters that would be representative of these possible COIs from a typical driveshaft shop (Section 6.0, References 2, 3, 4, 5, 6, 7, and 8).

### **3.0 FIELD ACTIVITIES**

Prior to mobilizing to the site to conduct subsurface sampling, Solutions-IES contacted North Carolina One Call and the City of Salisbury Public Utilities Department to locate underground utilities in the Study Area of the site. Pyramid Environmental & Engineering, P.C. (Pyramid) was contracted to perform an electromagnetic survey of the subsurface in the proposed right-of-way and easement area. Pyramid surveyed the Study Area on June 26 and June 29, 2006. The electromagnetic survey equipment (EM61) identified various magnetic anomalies within the Study Area, and Pyramid returned to the Study Area to perform a ground penetrating radar (GPR) survey utilizing a “Geophysical Survey Systems SIR 2000” instrument. Results of the surveys confirmed the locations of buried utilities along the eastern portion of the site, but did not indicate the presence of buried metallic underground storage tanks (USTs). The EM61 images are included on **Figures 3, 4 and 5** in **Appendix B**. A GPR image was not included in the geophysical report for the site.

After reviewing the geophysical report, Solutions-IES mobilized to the site and obtained soil samples from various locations within the Study Area. These activities were conducted on July 17, 2006. A total of seven soil borings (borings INDB1 through INDB7) were collected from the Study Area from the locations depicted on **Figure 3**. The borings were labeled “IND” to designate the current property owner, Industrial Supply Solutions. Soil boring INDB1 was advanced to a total depth of 12 feet below ground surface (ft bgs) while borings INDB2 through INDB7 were advanced to a total depth of 8 ft bgs. All borings were advanced with a truck-mounted Geoprobe®. Borings INDB1 through INDB7 were generally spaced approximately 20 feet apart on the north-south axis of the Study Area parallel to East “A” Avenue. All borings were located between 10 and 22 feet from the edge of East “A” Avenue (**Figure 3**).

Soil samples were obtained from each boring using a MacroCore® sampler fitted with single-use, disposable polyvinyl chloride liners. Each liner was 4 feet in length. Upon retrieval, each soil sample was split into two aliquots of 2 feet in length. The aliquots were placed in separate resealable plastic

bags. One bag was placed on ice for possible laboratory analysis, and the remaining bag was sealed and placed at ambient temperature for field screening with a flame ionization detector (FID).

Volatile organic compounds (VOCs) were allowed to accumulate in the headspace of each bag for approximately 20 minutes, after which time each sealed bag was scanned with the FID. The FID readings were entered on the boring logs along with the soil description and indications of notable staining or odors, if present. Logs for each boring are presented in **Appendix C**. Soils from the borings at the Drive Shaft Shop Study Area generally consisted of sandy or clayey silt (ML) and mottled silty clay (CL).

Headspace screening of the soil samples revealed the presence of volatile vapors in several of the samples screened with the FID. Concentrations ranged from 3.1 part per million (ppm) (INDB3, 0.5-2 ft bgs) to 373 ppm (INDB5, 4-6 ft bgs). These measurements are presented in **Table 1**. No distinguishable odors were noted in these soil samples.

Soil samples for laboratory analysis were retained from each boring at the sample intervals identified in **Table 1**. These samples were selected for analysis as they presented the highest FID measurements within the borings, or, if no volatile vapors were present, were obtained from the 6 – 8 ft bgs depth interval. The samples were placed in laboratory-supplied containers and stored on ice pending shipment to Pace Analytical Services, Inc. in Huntersville, NC. Sample information was recorded on the chain-of-custody and the samples were submitted for chemical analysis of select metals (chromium, manganese, nickel and zinc) by EPA Method 6010, VOCs by EPA Method 8260, semi-volatile organic compounds (SVOCs) by EPA Method 8270, petroleum-based lubricants and total petroleum hydrocarbons (TPH) by Modified EPA Method 5030/8015, and by Modified EPA Method 3545/8015.

#### **4.0 SAMPLING RESULTS**

The analytical data indicate the presence of metals including chromium, manganese, nickel, and zinc in concentrations above the laboratory reporting limits. Total chromium is present in concentrations exceeding the soil cleanup levels provided in Table 3 of the North Carolina Department of Environment and Natural Resources (NCDENR) “Groundwater Section Guidelines for the Investigation and Remediation of Soil and Groundwater” (July 2000) (GW Section Guidelines) in soil samples from borings INDB1, INDB2, INDB4, and INDB5. Soil cleanup levels are not provided for manganese, nickel

and zinc. Total petroleum hydrocarbons as Diesel-Range Organics (TPH DRO), or petroleum based lubricants, were detected in a single sample (INDB7 6-8) at a concentration of 19 mg/kg. Analytical data for the remaining samples retained from the site revealed no VOCs, SVOCs, or TPH Gasoline-Range Organics (GRO) in concentrations above the laboratory reporting limits. These analytical data are summarized in **Table 2**. Laboratory reports associated with these samples are presented in **Appendix D**. The TPH DRO detected in INDB7 6-8 does not exceed the TPH DRO “Action Level” of 40 mg/kg as provided by the GW Section Guidelines.

## 5.0 DISCUSSION AND CONCLUSIONS

The geophysical survey conducted at the site did not reveal buried metallic USTs within the Study Area. The survey did suggest metallic anomalies in locations consistent with the presence of buried utility lines or conduits.

Solutions-IES advanced seven soil borings to determine the presence or absence of COIs in the Study Area on the parcel, as well as document soil conditions. Soil samples obtained from the borings and screened with an FID revealed the presence of volatile vapors in some samples at concentrations ranging from 3.1 to 373 ppm. However, the analytical data for soils samples submitted for chemical analysis showed that TPH GRO, TPH DRO, VOCs and SVOCs were detectable with the exception of one report of TPH-DRO in INDB7 6-8, which did not exceed the respective “Action Level”.

The investigation data results revealed the presence of select metals, with chromium detected at concentrations exceeding the soil cleanup levels provided in the GW Section Guidelines. Four of the seven samples submitted for analysis exceeded the chromium soil cleanup level. The analytical method utilized for the chromium analyses did not speciate trivalent and hexavalent chromium. However, these results do not exceed the North Carolina Industrial Risk-Based Preliminary Remediation Goal (PRG) which is 100,000 mg/kg for trivalent chromium, and 64 mg/kg for hexavalent chromium, as provided in Appendix 3a in the North Carolina Division of Waste Management Hazardous Waste Section “Guidelines for Establishing Remediation Goals at RCRA Hazardous Waste Sites” (May 2005). Data collected from other Study Areas during this investigation along the Grade Separation at Klumac Road suggest that the range of chromium detected in the Drive Shaft Shop area is similar to chromium concentrations detected in surrounding properties. Chromium analyses were performed on soil borings collected from the Johnson Chemical Plant Study Area and the Former FCX Chemical Plant Study Areas. These properties

are located south/southeast of the Drive Shaft Shop (**Figure 2**). **Table 3** provides a summary of data from these three locations. Given the range of chromium concentration (14 to 74 mg/kg) and average concentrations across the area soils ( $34 \pm 17$  mg/kg) it is likely that the chromium results for the Drive Shaft Shop reflect background concentrations naturally present in area soils. However, additional investigation may be necessary to confirm the background concentrations of chromium.

Additionally, the investigation data show that soil concentrations of manganese exceeded the laboratory reporting limit in all seven soil samples, with results ranging from a low of 42 mg/kg (INDB2 6 – 8 ft bgs) to a high of 5,400 mg/kg manganese (INDB1 6 – 8 ft bgs). GW Section Guidelines do not provide a soil cleanup level for manganese. These manganese detections may be representative of naturally occurring manganese, or may be related to industrial processes that are used or were historically used in the manufacturing of driveshafts and drivetrain components.

## **1.0 INTRODUCTION**

Pyramid Environmental & Engineering, P.C. conducted geophysical investigations for Solutions Industrial & Environmental Services, Inc. during the period of June 26 through July 7, 2006, within the proposed Right-of-Way (ROW) areas at five sites along the proposed Klumac Road realignment project area in Salisbury, North Carolina. The work was done as part of the North Carolina Department of Transportation (NCDOT) road-widening project under State Project WBS Element 34951.1.1 (TIP # U-3459). The five sites are located along or adjacent to the intersection of Old South Main Street and East “A” Avenue in Salisbury.

Geophysical investigations were conducted across the eastern edges of the Southern Motors and the Duke Power substation properties located along the west side of East “A” Avenue. Investigations were also conducted along the western edge of The Drive Shaftshop property located along the east side of East “A” Avenue. The western edge of the former FCX Chemical site and the eastern portion of the Johnson Concrete facility, located south of Old Main Street, were also included in the geophysical investigation. The geophysical surveys were conducted to determine if unknown metallic underground storage tanks (USTs) were present beneath the proposed ROW area of each site.

Solutions Industrial and Environmental Services representative, Ms. Sheri Knox, PE, provided maps to Pyramid Environmental during the week of May 22, 2006 that outlined the geophysical survey area of each site. A site map and photographs showing the geophysical survey areas of the five sites are presented in **Figure 1**.

## **2.0 FIELD METHODOLOGY**

Prior to conducting the geophysical investigations, a 10-foot by 20-foot survey grid was established across the proposed ROW areas of the five sites using water-based marking paint and pin flags. These marks were used as X-Y coordinates for location control when collecting the geophysical data and establishing base maps for the geophysical results.

The geophysical investigations consisted of electromagnetic (EM) induction-metal detection surveys and ground penetrating radar (GPR) surveys. The EM surveys were performed using a Geonics EM61-MK1 metal detection instrument. According to the manufacturer's specifications, the EM61 can detect a metal drum down to a maximum depth of approximately 8 feet. The EM61 data were digitally collected at each site along parallel northerly-southerly trending survey lines spaced five feet apart. The data were downloaded to a computer and reviewed in the office using the Geonics DAT61W and Surfer for Windows Version 7.0 software programs.

Contour plots of the EM61 bottom coil results and the EM61 differential results for each site are included in this report. The bottom coil results represent the most sensitive component of the EM61 instrument and detect metal objects regardless of size. The bottom coil response can be used to delineate metal conduits or utility lines, small, isolated metal objects, and areas containing insignificant metal debris.

The differential results are obtained from the difference between the top and bottom coils of the EM61 instrument. The differential results focus on the larger metal objects such as drums and USTs and ignore the smaller insignificant metal objects.

GPR surveys were conducted across selected EM61 differential anomalies and steel-reinforced concrete using a GSSI SIR-2000 unit equipped with a 400 MHz antenna. GPR data were digitally collected in a continuous mode along X and/or Y survey lines, spaced two to five feet apart using a vertical scan of 512 samples, at a rate of 48 scans per second. An 80 MHz high pass filter and an 800 MHz low pass filter were used during data acquisition with the 400 MHz antenna. GPR data were collected down to a maximum depth of approximately five feet, based on an estimated two-way travel time of 10 nanoseconds per foot.

The GPR data were downloaded to a field computer and later reviewed in the office using Radprint software. The locations of GPR survey areas or individual GPR survey lines are shown as dashed, purple rectangles or solid purple lines, respectively on the EM61 differential contour plots. Photos of

the EM61 and GPR instruments are shown in **Figure 2**. During the weeks of June 26 and July 10, 2006, preliminary contour plots of the EM61 bottom coil and the differential results were emailed to Ms. Knox and Ms. Heather Markell.

### **3.0 DISCUSSION OF RESULTS**

#### **3.1 East Avenue “A” Sites**

The East Avenue “A” sites consist of the geophysical survey areas across portions of the Southern Motors, Duke Power substation, and The Driveshaft Shop properties. **Figure 3** shows the geophysical survey area and the geophysical survey lines across the above three properties. The red dots on the plot represent the approximate locations of the EM61 metal detection survey lines. Each dot represents a data point location. The purple lines represent the approximate locations of the GPR survey lines that were acquired across selected EM61 anomalies and areas containing steel reinforced concrete.

The bottom coil results and the differential results are presented in **Figures 4 and 5**, respectively. The linear EM61bottom coil anomalies intersecting grid coordinates X=40 Y=88, X=40 Y=380, X=60 Y=62, X=60 Y=120, X=64 Y=360, X=70 Y=250, X=70 Y=287, and X=120 Y=114, are probably in response to buried utility lines or conduits. The linear anomaly intersecting grid coordinates X=45 Y=180, is probably in response to the metal fence that surrounds the Duke Power substation property. The majority of the remaining bottom coil anomalies are probably in response to known cultural features such as manhole covers, storm sewer grates, and steel reinforced concrete.

GPR surveys conducted across the differential anomalies centered near grid coordinates X=5 Y=202, X=40 Y=237, and X=73 Y=390, suggest the anomalies are in response to miscellaneous metal debris or conduits. GPR surveys conducted across the concrete pavement centered near grid coordinates X=15 Y=410, and X=115 Y=160, suggest the metal detection anomalies recorded at these areas are probably in response to steel reinforcement in the concrete. The geophysical

investigation did not detect the presence of buried metallic USTs within the surveyed areas of the Southern Motors, The Driveshaft Shop and the Duke Power substation properties.

### **3.2 Johnson Concrete & Former FCX Chemical Sites**

**Figure 6** shows the geophysical survey area across the western portion of the Johnson Concrete facility and the eastern edge of the former FCX Chemical property. Similar to Figure 3, the red dots on the plot represent the approximate locations of the EM61 metal detection survey lines. Each dot represents a data point location. The purple lines represent the approximate locations of the GPR survey lines that were acquired across selected EM61 anomalies and areas containing steel reinforced concrete. The plot shows that nearly half of the proposed ROW area on the Johnson Concrete property contains concrete culverts, equipment and other supplies that obstructed the geophysical investigation.

The bottom coil results and the differential results for the Johnson Concrete and former FCX Chemical properties are presented in **Figure 7**. The linear EM61bottom coil anomaly intersecting grid coordinates X=80 Y=750, is probably in response to a buried utility line or conduit. The numerous bottom coil anomalies located around X=20 Y=270, and X=90 Y=680, are probably in response to buried, miscellaneous, metal debris or objects. The remaining anomalies are probably in response to adjacent supplies, surface equipment or steel reinforced concrete.

GPR surveys conducted across the large steel reinforced concrete slab and the adjacent concrete footing centered near grid coordinates X=25 Y=380, and X=17 Y=530, respectively, suggest that these two areas do not contain metallic USTs. GPR surveys conducted across the EM61 differential anomalies centered near grid coordinates X=67 Y=385, X=85 Y=690, and X=102 Y=270, suggest that the metal detection anomalies are probably in response to miscellaneous metal debris. The

geophysical investigation results suggest the surveyed portions of the Johnson Concrete facility and the former FCX Chemical property do not contain buried metallic USTs.

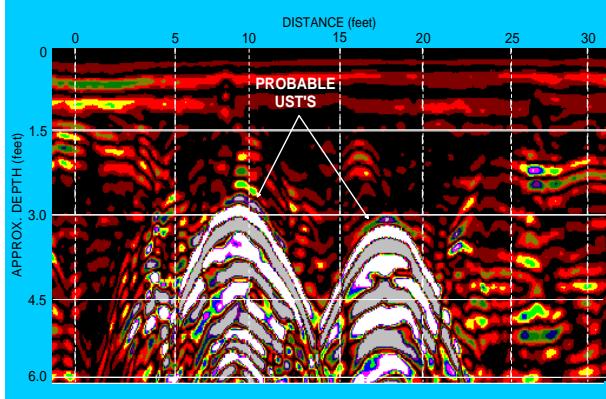

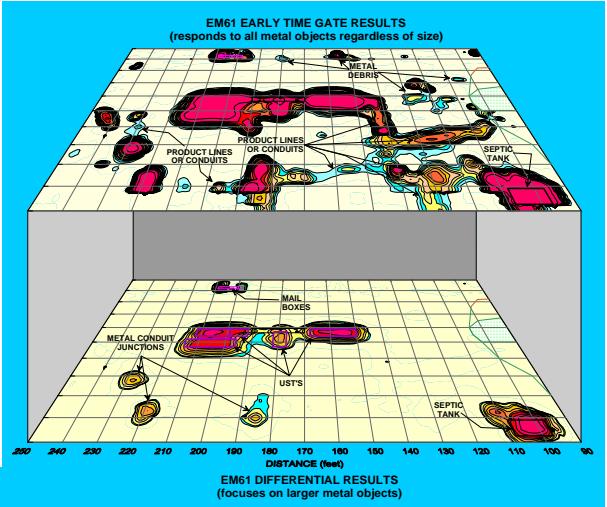

#### **4.0 SUMMARY & CONCLUSIONS**

Our evaluation of the EM61 and GPR data collected across the proposed ROW areas at the Klumac Road Realignment site located along Old South Main Street and East “A” Avenue in Salisbury, North Carolina provides the following summary and conclusions:

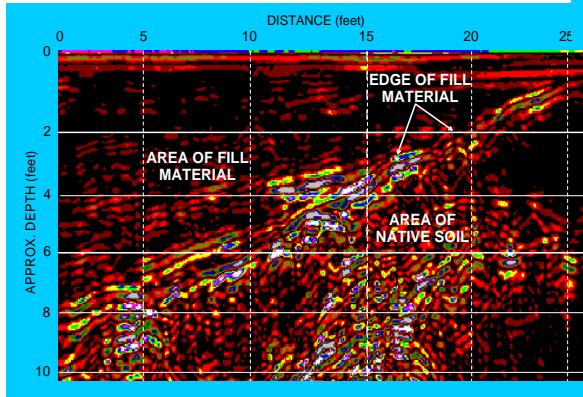

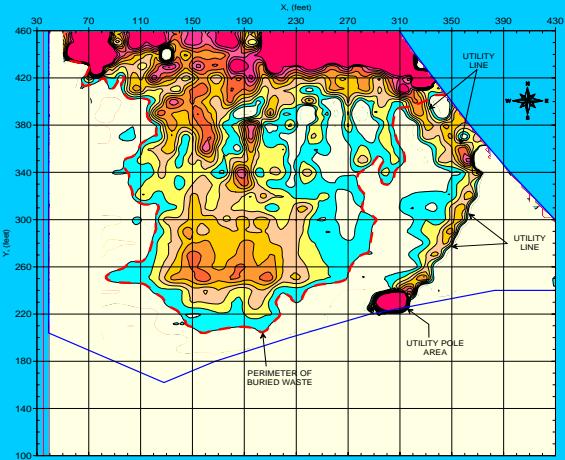

- The EM61 and GPR surveys provided reliable results for the detection of metallic USTs within the surveyed portions of the Southern Motors, Duke Power substation, The Driveshaft Shop, Johnson Concrete, and the former FCX Chemical properties.
- GPR surveys were conducted across selected EM61 differential anomalies and across areas containing steel reinforced concrete.
- At the East “A” Avenue sites, the linear EM61 anomalies intersecting grid coordinates X=40 Y=88, X=40 Y=380, X=60 Y=62, X=60 Y=120, X=64 Y=360, X=70 Y=250, X=70 Y=287, and X=120 Y=114, are probably in response to buried utility lines or conduits. The remaining metal detection anomalies are probably in response to known cultural features or to buried miscellaneous metal debris.
- The linear EM61 anomaly intersecting grid coordinates X=80 Y=750, at the Johnson Concrete property is probably in response to a buried utility line or conduit. The remaining metal detection anomalies recorded at the Johnson Concrete and the former FCX Chemical properties are probably in response to adjacent surface equipment, steel reinforced concrete, or buried miscellaneous metal debris.
- The geophysical investigations results did not detect the presence of metallic USTs within the surveyed portions of the five properties.

## **5.0 LIMITATIONS**

EM61 and GPR surveys have been performed and this report prepared for Solutions Industrial & Environmental Services, Inc. in accordance with generally accepted guidelines for EM61 and GPR surveys. It is generally recognized that the results of the EM61 and GPR are non-unique and may not represent actual subsurface conditions. The EM61 and GPR results obtained for this project do not conclusively determine that metallic USTs are not present across the surveyed portions of the five sites but only suggest that none were detected. Some anomalies may be attributed to other surface or subsurface conditions or cultural interference.

## FIGURES

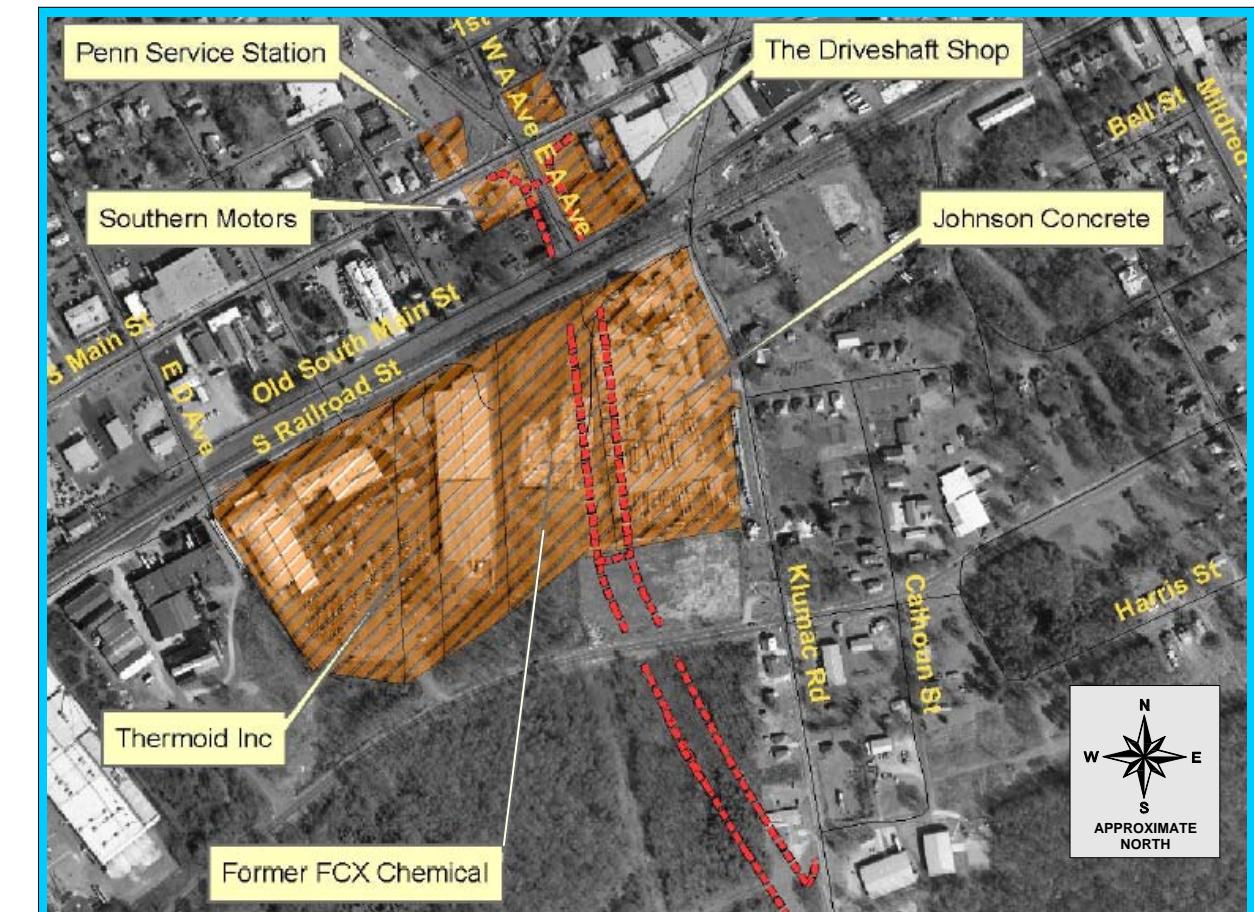

The photo shows the geophysical survey area across portions of the Southern Motors, The Driveshaft Shop and the Duke Power substation properties located along East "A" Avenue. The photo is viewed in a northerly direction.

The photo shows the geophysical survey area across the western edge of the Johnson Concrete facility. The photo is viewed in a northerly direction.

The photo shows the locations of the Southern Motors, Duke Power substation, The Driveshaft Shop, Johnson Concrete, and the former FCX Chemical properties where geophysical investigations were conducted. The map was obtained from Solutions-IES/NCDOT.

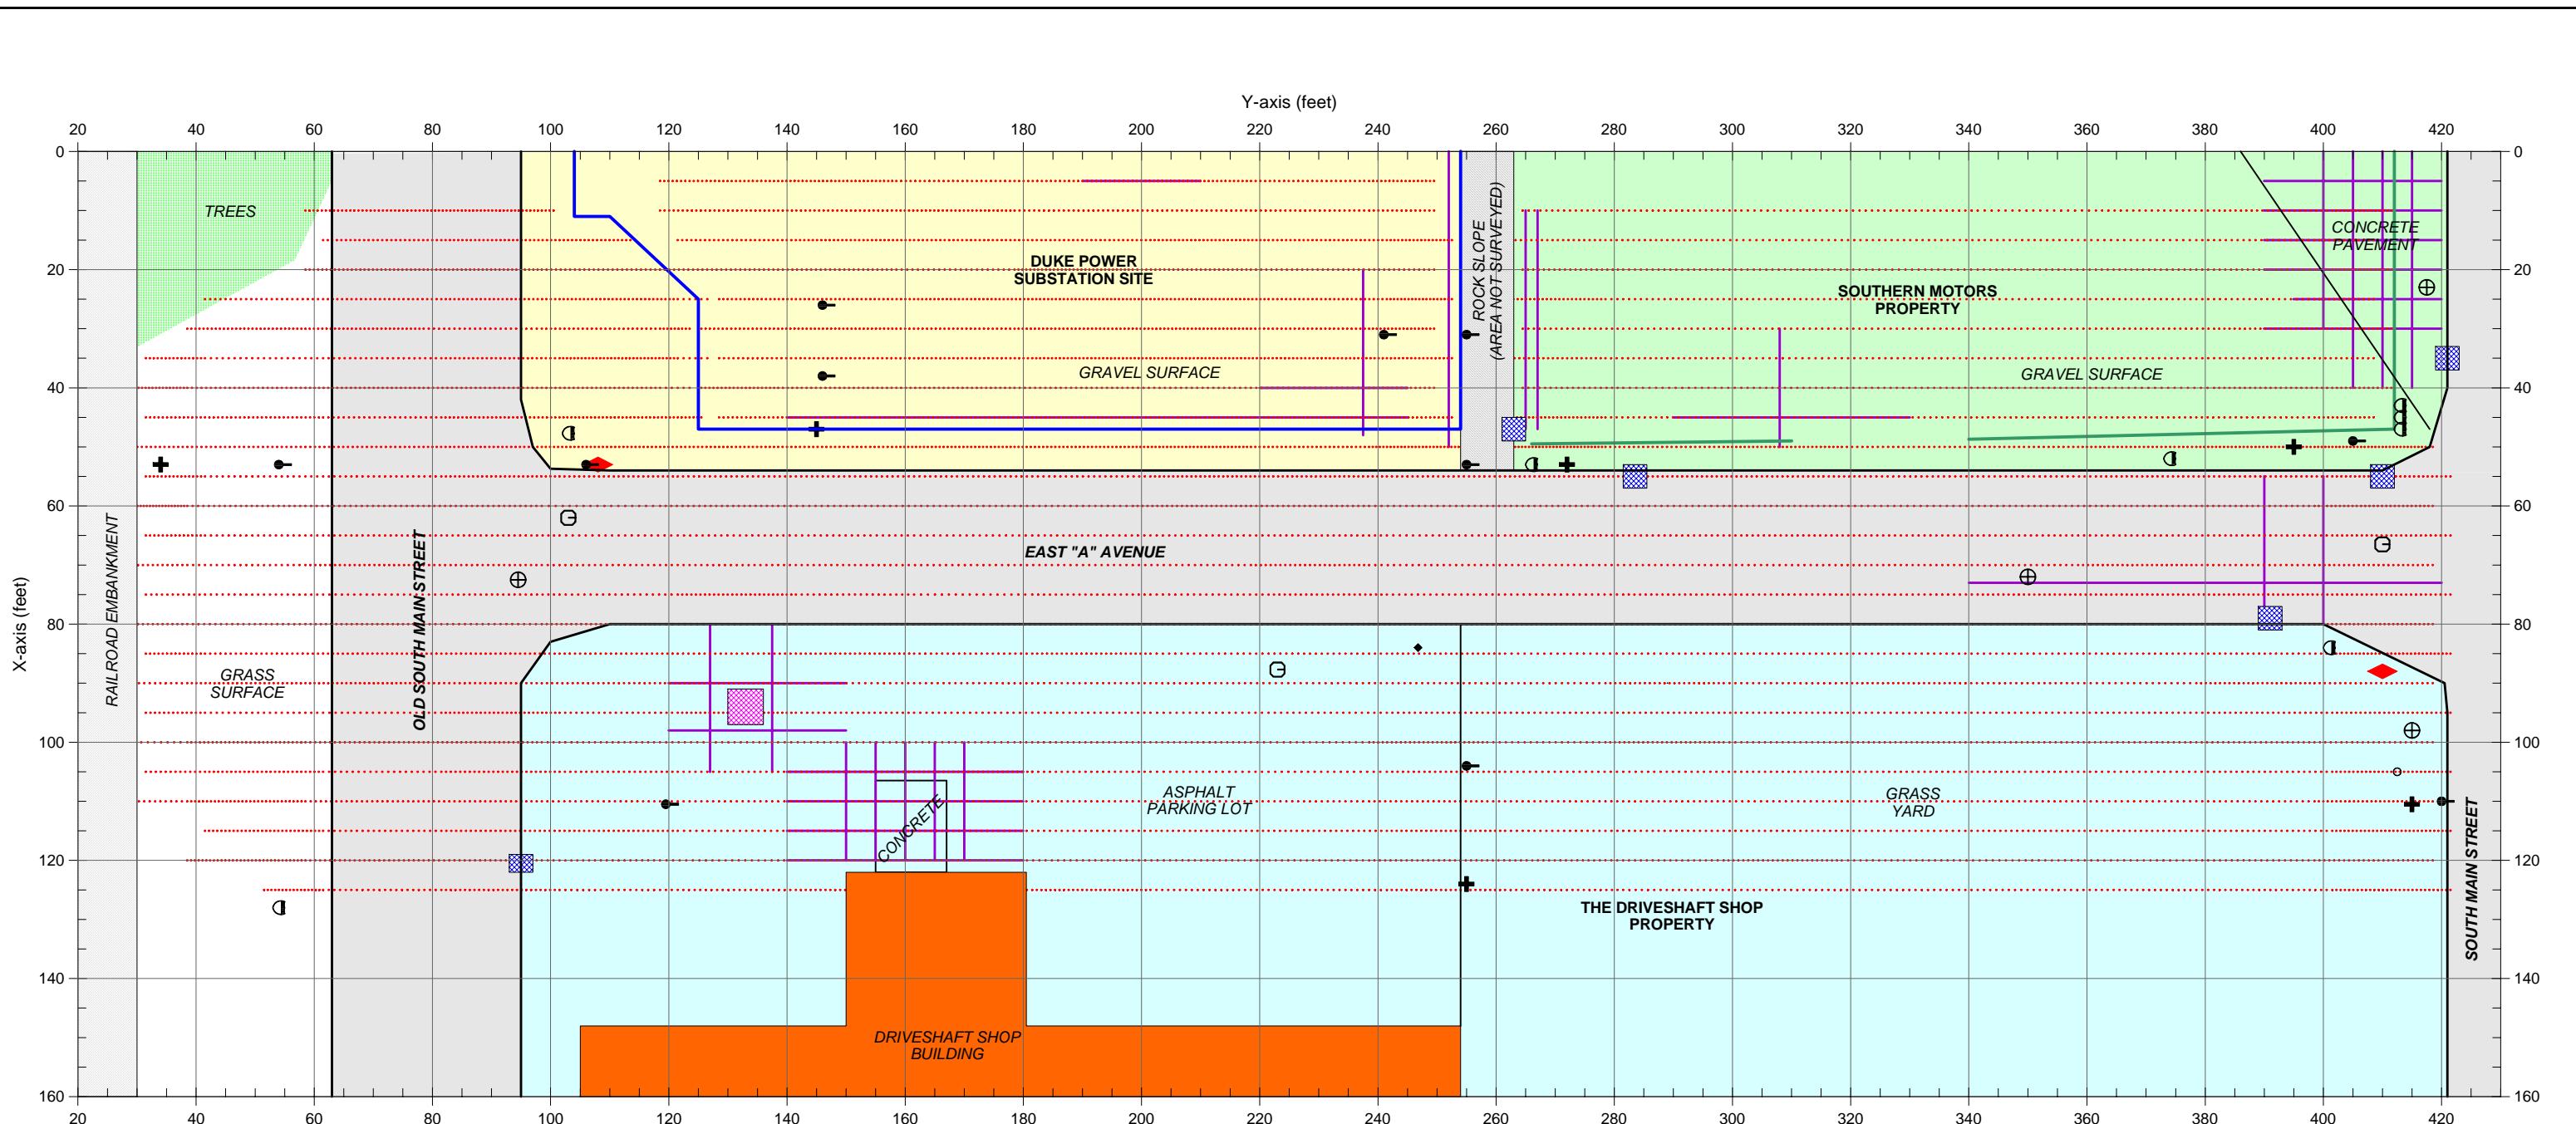

The photo shows the geophysical survey area across the eastern edge of the Former FCX Chemical site located contingent to the Johnson Concrete facility shown above. The photo is viewed in a northerly direction.

The photo shows the Geonics EM61 metal detector that was used to conduct the metal detection survey at the Old South Main Street and East "A" Avenue sites in Salisbury, North Carolina on June 26, 27, and July 7, 2006. The instrument has a maximum investigating depth of approximately 8 feet.

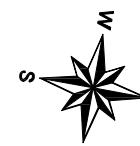

The photos show the SIR-2000 GPR system equipped with a 400 MHz antenna that were used to conduct the ground penetrating radar investigation at the Old South Main Street and East "A" Avenue sites in Salisbury, North Carolina on June 29 & July 7, 2006.

Dear Mr. Peoples:

Enclosed are the analytical results for sample(s) received by the laboratory on July 18, 2006. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

Inorganic Wet Chemistry and Metals Analyses were performed at our Pace Asheville laboratory and Organic testing was performed at our Pace Charlotte laboratory unless otherwise footnoted.

If you have any questions concerning this report please feel free to contact me.

Sincerely,

for

#### GC Semivolatiles

TPH in Soil by 3545/8015	Prep/Method: EPA 3545 / EPA 8015
Diesel Fuel	ND mg/kg 6.8
n-Pentacosane (S)	72 %
Date Extracted	07/19/06 07/19/06

#### GC Volatiles

GAS, Soil, North Carolina	Method: EPA 8015
Gasoline	ND mg/kg 5.0
4-Bromofluorobenzene (S)	68 %

#### GC/MS Volatiles

GC/MS VOCs 5035/8260 low level	Method: EPA 8260
Acetone	ND ug/kg 110
Benzene	ND ug/kg 5.7
Bromobenzene	ND ug/kg 5.7
Bromochloromethane	ND ug/kg 5.7
Bromodichloromethane	ND ug/kg 5.7
Bromoform	ND ug/kg 5.7
Bromomethane	ND ug/kg 11.
2-Butanone (MEK)	ND ug/kg 110
n-Butylbenzene	ND ug/kg 5.7
sec-Butylbenzene	ND ug/kg 5.7
tert-Butylbenzene	ND ug/kg 5.7
Carbon tetrachloride	ND ug/kg 5.7
Chlorobenzene	ND ug/kg 5.7
Chloroethane	ND ug/kg 11.
Chloroform	ND ug/kg 5.7

Date Extracted	07/19/06			07/19/06			

#### GC Semivolatiles

TPH in Soil by 3545/8015	Prep/Method: EPA 3545 / EPA 8015
Diesel Fuel	ND mg/kg 6.7
n-Pentacosane (S)	103 %
Date Extracted	07/19/06 07/19/06

#### GC Volatiles

GAS, Soil, North Carolina	Method: EPA 8015
Gasoline	ND mg/kg 5.0
4-Bromofluorobenzene (S)	70 %

#### GC/MS Volatiles

GC/MS VOCs 5035/8260 low level	Method: EPA 8260
Acetone	ND ug/kg 110
Benzene	ND ug/kg 5.4
Bromobenzene	ND ug/kg 5.4
Bromochloromethane	ND ug/kg 5.4
Bromodichloromethane	ND ug/kg 5.4
Bromoform	ND ug/kg 5.4
Bromomethane	ND ug/kg 11.
2-Butanone (MEK)	ND ug/kg 110
n-Butylbenzene	ND ug/kg 5.4
sec-Butylbenzene	ND ug/kg 5.4
tert-Butylbenzene	ND ug/kg 5.4
Carbon tetrachloride	ND ug/kg 5.4
Chlorobenzene	ND ug/kg 5.4
Chloroethane	ND ug/kg 11.
Chloroform	ND ug/kg 5.4

#### PARAMETER FOOTNOTES

Method 9071B modified to use ASE.

All pH, Free Chlorine, Total Chlorine and Ferrous Iron analyses conducted outside of EPA recommended immediate hold time.

Depending on the moisture content the PRLs can be elevated for all soil samples reported on a dry weight basis.

2-Chloroethyl vinyl ether has been shown to degrade in the presence of acid.

ND	Not detected at or above adjusted reporting limit
NC	Not Calculable
J	Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit
MDL	Adjusted Method Detection Limit
(S)	Surrogate
[1]	Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of the two remaining acid surrogates.
[2]	Base/neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

#### QUALITY CONTROL DATA PARAMETER FOOTNOTES

Consistent with EPA guidelines, unrounded concentrations are displayed and have been used to calculate % Rec and RPD values.

LCS(D) Laboratory Control Sample (Duplicate)  
 MS(D) Matrix Spike (Duplicate)  
 DUP Sample Duplicate  
 ND Not detected at or above adjusted reporting limit  
 NC Not Calculable  
 J Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit  
 MDL Adjusted Method Detection Limit  
 RPD Relative Percent Difference  
 (S) Surrogate  
 [1] Recovery falls outside of QC limits, however, this compound is not found in the associated samples.  
 [2] The spike recovery was outside acceptance limits for the MS and /or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
