ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.

DESCRIPTION: Grier Road (SR 2976) Grade Separation from South of Orr Road (SR 2426) to Old Concord Road (SR 2848)
SUBJECT: Roadway Subsurface Investigation – Inventory

PROJECT DESCRIPTION

The Grier Road Grade Separation project involves the following:

- Realignment of Grier Road and extension from the existing intersection with Orr Road to Old Concord Road.
- Construction of a new three bent, two span grade separation along the extended portion of Grier Road carrying the new alignment over the Norfolk Southern / North Carolina Railroad (NCRR) corridor.
- Realignment and drastic grade changes along Old Concord Road. A temporary detour road will also be constructed along this corridor to maintain traffic during construction.
- Realignment of a portion of Orr Road.
- Reconfiguration of the intersection between Orr and Grier Roads.
- Closure of the existing at-grade crossing between NS/NCRR and Newell Hickory Grove Road.
- Construction and or reconfiguration of various secondary roads, residential driveways, and access drives.

The majority of significant grading work will be performed within the general vicinity of the new grade separation and along Old Concord Road. The grade separation is located at a relative high point of the project site. At this location, the existing rail corridor is in a slight cut on the order of 5 feet. On the south side of the rail corridor, an embankment on the order of 25 feet is required to provide adequate grade separation. The embankment height tapers down rapidly as the alignment approaches Orr Road. On the north side of the rail corridor, the existing grades drop gradually in a north and northeasterly direction. In order to facilitate the intersection with Grier Road (within about 100 feet of the grade separation), Old Concord Road will be raised significantly to meet the proposed grades. At the intersection, proposed fill height is on the order of 40 feet. As Old Concord Road continues to the northeast (upstation), fill heights increase up to approximately 60 feet where the alignment crosses a small tributary to Toby Creek. This crossing is currently facilitated by a 3 foot by 4 foot reinforced concrete box culvert. (RCBC). We understand new accommodations are proposed to facilitate drainage beneath the new embankment as necessary. Beyond this point existing grades rise and proposed embankment grades converge quickly to meet the existing alignment. Fill slopes on the south and eastside of Old Concord Road are predominantly bounded by the existing railroad embankment, such that the toe of the new fill slope intersects the existing rail slopes. Fill slopes on the north and west side of Old Concord Road predominantly intersect relatively flat ground, in some cases sloping mildly away from the alignment. The majority of the remaining roadway realignments consist of mild cuts and fills on the order of 5 feet or less.

A total of twenty-two (22) Standard Penetration Test (SPT) borings were drilled for the new roadway alignments. An additional six (6) borings were drilled for the bridge structure and are included in the separate Structure Subsurface Investigation Report. The end bent borings have been utilized in this report since they provide additional pertinent subsurface information relating to approach embankments. The approximately locations of each boring are shown on the boring location plans, sheets 8 through 10 of this report. All borings were drilled using CME-55 all-terrain-vehicle (ATV) mounted or CME-55 truck mounted drill rigs equipped with 2¼-inch inside diameter hollow-stem augers and automatic hammers. Representative soil samples, collected with a split-barrel sampler, were selected for laboratory testing to verify visual field classifications. SPT borings were performed in general accordance with the American Association of State Highway Transportation Officials (AASHTO T-206 and T-225).

The following alignments, totaling approximately 5,536 feet (1 mile) were explicitly investigated. Subsurface profiles and cross sections of these alignments are included in this report.

Line	Station
Grier Road (-L-)	10+00 – 21+15
Orr Road (-Y1-)	11+50 – 44+11
Old Concord Road (-Y2-)	10+00 – 21+60

Subsurface profiles and cross sections showing the existing and proposed grades along Grier Road, Old Concord Road, and Orr Road are included in this report on pages 11 through 19. Boring logs are included on pages 19 through 31.

AREAS OF SPECIAL GEOTECHNICAL INTEREST

Borings at the following locations contained topsoil and/or rootmat exceeding four (4) inches in thickness:

Station	Offset
-L- 11+03	30 ft LT
-L- 11+10	27 ft RT
-L- 12+75	30 ft LT
-L- 12+75	30 ft RT

Large rootballs and thick rootmat exceeding four inches should be expected in other areas throughout the site, particularly areas which are wooded or were minimally disturbed during previous clearing/grading operations.

Borings in the following locations contained clayey/silty soils with medium to high plasticity (A-7) near the ground surface. These soils degrade rapidly when exposed to water and may not provide adequate support for fill placement.

Station	Offset
-L- 10+00 to18+90	30 ft LT to 30 ft RT
-Y1- 18+01 to 28+02	23 ft LT to 23 ft RT
-Y1- 32+00	5 ft LT
-Y1- 36+06 to 41+91	20 ft LT to 23 ft RT
-Y2- 10+00 to 20+00	CL to 16 ft RT

Shallow groundwater (less than 6 feet from existing grades) was encountered in borings at the following locations:

Station	Offset
-L- 16+85	16 ft LT
-Y1- 38+00	23 ft RT
-Y2- 18+22	CL

PHYSIOGRAPHY AND GEOLOGY

According to the ***Geologic Map of North Carolina*** (1985), the proposed site is located within the Charlotte Belt region of the Western Piedmont of North Carolina. Specifically, bedrock at the site is noted to consist of metamorphosed quartz diorite **(PzZq)** noted as both foliated and massive in structure.

Topographically, the site generally exhibits the gently rolling terrain of the North Carolina Piedmont. Existing grades along the north side of the rail corridor appear to be largely natural with the exception of roadway embankment along Old Concord Road, and minor grading associated with secondary and access roads and home sites. South of the rail corridor, the topography is much flatter. This portion of the site is an industrial area with large, flat, multi-acre fenced yards. Artificial slopes are evident in places along borders between properties, and it appears that significant grading has been performed throughout the area. Residential and landscaped areas nearby exhibit apparently natural gently rolling terrain.

The wooded area between Old Concord Road and the existing railroad embankment contains a number of small draws and tributaries which drain into the previously mentioned RCBC. The floodplain along these drainage features appears to be very minimal, with steep banks and quickly rising terrain. Very few low-lying or flat areas were observed outside of the immediate vicinity of the actual streams.

SOIL PROPERTIES

In general, the subsurface soil conditions encountered across the site were relatively consistent. Some roadway embankment fill soils were present along portions of Old Concord Road (borings R-1 through R-4, R-10, and R-12). All other borings encountered residual soils at the ground surface or immediately beneath pavement and/or base course materials. In boring R-10, approximately 10 feet of alluvial soil was encountered immediately beneath the roadway embankment. Residual soil was encountered beneath the alluvial deposits.

The majority of the borings exhibited a relatively consistent residual soil profile. A relative thin (typically 3 to 10 feet thick) "cap" of fine-grained, moderately to highly plastic silts and clays was encountered at the residual surface, underlain by increasingly coarse grained residual soils, gradually increasing in consistency before transitioning to weathered rock and rock. Some exceptions include areas where the fine grained surface soils were thicker, areas where it appears some or all of these materials have been removed previously by roadway or site grading operations, areas with a very thin transitional weathered rock strata, and areas with interlayered weathered rock or weathered boulders.

Roadway Embankment soils encountered consisted of soft to very stiff sandy and silty clays (A-6, A-7) and loose to medium dense silty sands (A-2-4) with gravel and sparse trace organics and mica.

Alluvial soils were encountered in roadway boring R-10 only, consisting of very stiff sandy clay (A-6) and clayey sand (A-2-6) with gravel, generally increasing in grain size with depth.

Residual soils encountered consisted of loose to very dense silty and clayey sands (A-2-4, A-2-6) and medium stiff to hard silts and clays with varying amounts of sand (A-4, A-5, A-6, A-7) with trace root matter, gravel-sized rock fragments, weathered rock layers, and varying amounts of mica. Some residual soils were noted to be saprolitic.

Weathered rock was encountered in most of the deeper borings underlying residual soils and extending to boring termination or auger refusal depths. Weathered rock materials consist of tan, brown, and gray granitic rock, with varying degrees of low-grade metamorphism. Auger and/or SPT refusal, indicating the presence of crystalline rock, was encountered in borings R-8 and EB1-A borings at elevations ranging of approximately 753.4 and 746.5 feet NAVD, respectively (depths of 23.6 and 37.5 feet below existing grades).

GROUNDWATER PROPERTIES

Groundwater levels were measured at the time of boring completion, and in most cases after at least 24 hours. Groundwater was encountered in most of the borings either by verifying the presence of water or noting a saturated "cave-in" which could potentially indicated the presence of groundwater. These elevations range between 732 and 798 feet, NAVD. Specific groundwater information for each boring can be found in the boring logs in this report.

THE SUBSURFACE INFORMATION AND THE SUBSURFACE INVESTIGATION ON WHICH IT IS BASED WERE MADE FOR THE PURPOSE OF STUDY, PLANNING, AND DESIGN, AND NOT FOR CONSTRUCTION OR PAY PURPOSES. THE VARIOUS FIELD BORING LOGS, ROCK CORES, AND SOIL TEST DATA AVAILABLE MAY BE REVIEWED OR INSPECTED IN RALEIGH BY CONTACTING THE N.C. DEPARTMENT OF TRANSPORTATION, GEOTECHNICAL ENGINEERING UNIT AT (919) 707-6850. NEITHER THE SUBSURFACE PLANS AND REPORTS, NOR THE FIELD BORING LOGS, ROCK CORES, OR SOIL TEST DATA ARE PART OF THE CONTRACT.

GENERAL SOIL AND ROCK STRATA DESCRIPTIONS AND INDICATED BOUNDARIES ARE BASED ON A GEOTECHNICAL INTERPRETATION OF ALL AVAILABLE SUBSURFACE DATA AND MAY NOT NECESSARILY REFLECT THE ACTUAL SUBSURFACE CONDITIONS BETWEEN BORINGS OR BETWEEN SAMPLED STRATA WITHIN THE BOREHOLE. THE LABORATORY SAMPLE DATA AND THE IN SITU (IN-PLACE) TEST DATA CAN BE RELIED ON ONLY TO THE DEGREE OF RELIABILITY INHERENT IN THE STANDARD TEST METHOD. THE OBSERVED WATER LEVELS OR SOIL MOISTURE CONDITIONS INDICATED IN THE SUBSURFACE INVESTIGATIONS ARE AS RECORDED AT THE TIME OF THE INVESTIGATION. THESE WATER LEVELS OR SOIL MOISTURE CONDITIONS MAY VARY CONSIDERABLY WITH TIME ACCORDING TO CLIMATIC CONDITIONS INCLUDING TEMPERATURES, PRECIPITATION, AND WIND, AS WELL AS OTHER NON-CLIMATIC FACTORS.

THE BIDDER OR CONTRACTOR IS CAUTIONED THAT DETAILS SHOWN ON THE SUBSURFACE PLANS ARE PRELIMINARY ONLY AND IN MANY CASES THE FINAL DESIGN DETAILS ARE DIFFERENT. FOR BIDDING AND CONSTRUCTION PURPOSES, REFER TO THE CONSTRUCTION PLANS AND DOCUMENTS FOR FINAL DESIGN INFORMATION ON THIS PROJECT. THE DEPARTMENT DOES NOT WARRANT OR GUARANTEE THE SUFFICIENCY OR ACCURACY OF THE INVESTIGATION MADE, NOR THE INTERPRETATIONS MADE, OR OPINION OF THE DEPARTMENT AS TO THE TYPE OF MATERIALS AND CONDITIONS TO BE ENCOUNTERED. THE BIDDER OR CONTRACTOR IS CAUTIONED TO MAKE SUCH INDEPENDENT SUBSURFACE INVESTIGATIONS AS HE DEEMS NECESSARY TO SATISFY HIMSELF AS TO CONDITIONS TO BE ENCOUNTERED ON THIS PROJECT. THE CONTRACTOR SHALL HAVE NO CLAIM FOR ADDITIONAL COMPENSATION OR FOR AN EXTENSION OF TIME FOR ANY REASON RESULTING FROM THE ACTUAL CONDITIONS ENCOUNTERED AT THE SITE DIFFERING FROM THOSE INDICATED IN THE SUBSURFACE INFORMATION.

SOIL AND ROCK LEGEND, TERMS, SYMBOLS, AND ABBREVIATIONS

SOIL DESCRIPTION

SOIL IS CONSIDERED TO BE THE UNCONSOLIDATED, SEMI-CONSOLIDATED, OR WEATHERED EARTH MATERIALS THAT CAN BE PENETRATED WITH A CONTINUOUS FLIGHT POWER AUGER, AND YIELD LESS THAN 100 BLOWS PER FOOT ACCORDING TO STANDARD PENETRATION TEST (AASHTO T206, ASTM D-1586). SOIL CLASSIFICATION IS BASED ON THE AASHTO SYSTEM. BASIC DESCRIPTIONS GENERALLY SHALL INCLUDE: CONSISTENCY, COLOR, TEXTURE, MOISTURE, AASHTO CLASSIFICATION, AND OTHER PERTINENT FACTORS SUCH AS MINERALOGICAL COMPOSITION, ANGULARITY, STRUCTURE, PLASTICITY, ETC. EXAMPLE:

VERY STIFF, GRAY, SILTY CLAY, MOIST WITH INTERBEDDED FINE SAND LAYERS, HIGHLY PLASTIC, A-7-6

ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FEET
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	> 4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.

FEDERAL PROJECT: N/A
COUNTY: Mecklenburg
DESCRIPTION: Millbrook Road (MP 365.5) to Junker (MP 372.2) on the NCRR/NS Mainline

SUBJECT: Geotechnical Report - Inventory

PROJECT DESCRIPTION

The project is located in Charlotte in central Mecklenburg County, North Carolina. This project consists of a proposed 3,680 feet, roadbed curve widening along –M1G- between Newell-Hickory Grove Road (-Y15-) and King George Drive as well as the 1,000 feet, Mallard Creek Church Road Detour (-A6-).

The geotechnical investigation was conducted during December of 2012 and February of 2013. Two drill machines, a CME 55 and a Mobile B-57 with automatic hammers, were used during the investigation. Standard Penetration Tests were performed at selected locations. Representative soil samples were collected for visual classification in the field and selected samples were submitted for laboratory analysis by Kleinfelder Southeast, Inc.

The following alignments, totaling 0.9 mile, were investigated. Profiles and cross sections of these alignments are included in this report.

PHYSIOGRAPHY AND GEOLOGY

The project is located in the Piedmont Physiographic Province. The project corridor is located along Old Concord Road and the existing NCRR/NS Mainline which is comprised primarily of commercial properties. The general topography of the site consists of rolling hills with flat to moderate slopes along the existing railway.

Geologically, the project is located within the Charlotte Belt based on the 1985 Geologic Map on North Carolina. Soils are derived from the underlying bedrock which consists of Paleozoic/Late Proterozoic age metamorphic rock (Metamorphosed Quartz Diorite). The overlying residual soils are the product of the physical and chemical weathering of the underlying Crystalline rock.

SOIL PROPERTIES

Soils encountered during this investigation are separated into two categories based on origin. They consist of artificial fill and residual soils.

Artificial Fill soils are present throughout the project along -M1G-consisting of sandy gravel (A-1-a) which is used as ballast and subballast along the existing railway. In addition, areas of artificial fill occur along -M1G- on Plan Sheet Nos. 24 through 26. The artificial file in these areas consists of fill that was utilized to grade the existing railway. Fill primarily consists of moist to wet, very soft to stiff, red, brown and black, micaceous, sandy, silty clay (A-7-6) with some wet, soft, red and brown, micaceous, sandy silt (A-4) and some wet, very loose, gray, silty sand (A-2-4). The artificial fill clay soils exhibit medium to high plastic indices ranging from 19 to 32.

Residual soils are derived from the weathering of underlying metamorphosed quartz diorite. These soils consist of moist, stiff to very stiff, red, yellow, orange, black, and light brown, sandy, silty clays (A-7-5), tan, gray, red, and yellow, loose to medium dense, moist, silty sand (A-2-4) and moist to wet, soft to very stiff, red, yellow, gray, brown, light to dark brown, sandy silts (A-4).

GROUNDWATER

Groundwater was not encountered during the investigation.
