1.0 INTRODUCTION

1.1 PURPOSE OF INVESTIGATION AND DESCRIPTION

CATLIN Engineers and Scientists (CATLIN) were retained by the North Carolina Department of Transportation (NCDOT) Geotechnical Engineering Unit to provide a field investigation concluding with a Preliminary Site Assessment (PSA) for the above referenced property. In response to a Request for Technical and Cost Proposal (RFP) dated April 1, 2010, and subsequent site reconnaissance and discussions with NCDOT GeoEnvironmental Project Manager Mr. Terry Fox, LG, CATLIN submitted a proposal for conducting an investigation at the above referenced parcel near Navassa, North Carolina. Figure 1 illustrates the general location and the Site Map is illustrated on Figure 2.

According to the RFP:

A proposed drainage ditch will cut through the southern part of this former meat packing plant located on this parcel. Although borings will be focused in this area, the investigation should also cover the east, west and northern side of this structure which is outside of the right of way. The types of contaminants that would have been used at this early 1900's operation are unknown, as is any record of illegal dumping.

The work scope as requested includes:

- Locate all underground storage tanks (USTs) and determine approximate size and contents (if any).
- Determine if contaminated soils are present.
- If contamination is evident, estimate the quantity of impacted soils and indicate the approximate area of soil contamination on a site map.

- Prepare a report including field activities, findings, and recommendations and submit in triplicate.

In addition to the RFP, NCDOT provided plan sheets associated with the roadway construction. CATLIN and NCDOT agreed to proposed boring and sample locations within the right-of-way and/or easement for soil sample collection and laboratory analysis for semi-volatile organics, volatile organics, and metals. Schnabel Engineering (Schnabel) was contracted directly by NCDOT and conducted a geophysical survey to determine the presence or absence of underground anomalies indicative of USTs. Subsequent to site reconnaissance and further scope clarification, it was determined that a grab groundwater sample would be collected from the proposed drainage feature area. CATLIN coordinated geophysical activities and conducted sampling after the geophysical survey. CATLIN's field activities concluded on May 25, 2010. This report documents our activities and findings.

1.2 BACKGROUND INFORMATION

The site contains a former meat packing plant. Brief historical research indicated the former plant has been abandoned since the 1930's. The property is located on the north side of Royster Road between Navassa Road and the Cape Fear River. The site is approximately 1.99 acres and is bordered to the north, south and east by a 899 acre hunting tract and property owned by Brunswick County to the west.

Potential contamination is unknown and according to the NCDENR UST Section Registry, there are no known facilities or groundwater incidents associated with the property. Reportedly a Brownfields Application has been submitted for this property and the property owners are working with a consultant on this site regarding a wetlands mitigation project.

During site reconnaissance at least seven (7) poly-vinyl chloride (PVC) monitoring wells were discovered on site. The property owner's representative did not have knowledge of groundwater sampling of these wells.

2.0 METHODS

Proposed borings were indicated on the NCDOT provided plan sheets and sent to NCDOT before finalizing the scope of work and cost estimate. During site reconnaissance, the approximate proposed/planned drainage feature was identified by GPS coordinate locations in the field.

Per NCDOT request, one (1) boring was advanced every 100 feet along the proposed drainage feature (a total of four borings, DPT-07 through DPT-10, along the drainage feature) for soil sample collection and laboratory analysis.

Three (3) soil borings were also advanced around the former meat packing plant (DPT-03, DPT-04, and DPT-06) and three (3) at possible meat packing plant operations areas (DPT-01, DPT-02, and DPT-05). A grab groundwater sample was also collected from the DPT-09 boring along the drainage feature and south of the former meat packing plant. A total of 10 borings were advanced and one soil sample from each boring was collected for laboratory analysis.

For regulatory purposes, soil sample results are compared to the North Carolina Inactive Hazardous Sites Branch (NC IHSB) Preliminary Health Based Preliminary Soil Remediation Goal (PSRG) and Protection of Groundwater Soil Remediation Goal (SRG) and / or the North Carolina Department of Environment and Natural Resources (NCDENR) Soil-to-Groundwater Maximum Contaminant Concentrations (MSCCs). Soils revealing concentrations above the MSCCs, PSRGs, or SRGs are considered impacted. For impacted soil volume estimating purposes, impacted soils are assumed to extend laterally (within the right-of-way and/or easement, and/or drainage feature only) half the distance to the closest "clean" sample location where possible.

Groundwater sample results are compared to the North Carolina Administrative Title 15A Subchapter 2L Groundwater Quality Standards (2L GWQS). Groundwater sample concentrations above the 2L GWQS are considered impacted.

2.1 FIELD METHODS

All field work was conducted in general accordance with state and federal guidelines and industry standards. A geophysical investigation was conducted by Schnabel. Schnabel's geophysical efforts were limited to areas surrounding the old building due to dense vegetation across the site. A copy of the geophysical report is provided in Appendix A.

Boring coordinates were collected utilizing a Trimble® Global Positioning System (GPS) unit. A North Carolina certified well driller advanced and properly abandoned all borings. CATLIN personnel gathered subsurface soil data at the site by Direct Push Technology (DPT) boring advancement using an AMS PowerProbe™ 9600D (PowerProbe). The borings were advanced to depth by static force and a 90-pound hydraulic percussion hammer. Two and one-quarter inch diameter by four-foot length steel is used as casing. Soil samples were continuously collected in four-foot long and one and one-half inch diameter clear liners. Liners are removed from the casing and then cut in half longitudinally to allow for visual/manual classification utilizing the Unified Soil Classification System (USCS). Soil samples were collected continuously from near the surface to boring termination. Soils were removed from the liners in two-

foot intervals and placed in sealable polyethylene bags for organic vapor analysis (OVA) headspace screening. The USCS and OVA information was recorded on field logs and has been transferred to the Boring Logs provided in Appendix B.

Soil samples were collected for laboratory analysis above the water table from the two-foot interval revealing the highest OVA reading. New disposable nitrile gloves were worn during sampling activities. All samples were placed into laboratory provided glassware and packed on ice in an insulated cooler for transportation to the laboratory. Sample integrity was maintained by following proper Chain of Custody procedures. A copy of the Chain of Custody is provided following the analytical report in Appendix C.

Following removal of the PowerProbe tooling at DPT-09, new polyethylene tubing was placed in the borehole and groundwater was pumped directly into the appropriate laboratory provided glassware utilizing a peristaltic pump.

Boreholes were abandoned to just below the surface using three-eighth inch bentonite chips. Bentonite and water were poured into the borehole simultaneously to facilitate hydration. Final borehole and sample locations were surveyed utilizing a Trimble® GPS survey instrument. Borehole locations and site features are illustrated on Figure 2.

2.2 LABORATORY TESTING

Following boring advancement, selected soils were placed in the appropriately labeled glassware. In an attempt to provide information regarding potential impact to soils with reasonable analytical expense, soil samples were analyzed for volatile and semi-volatile organics per Environmental Protection Agency (EPA) Methods 8260 and 8270, respectively. Soils were also analyzed for the presence of metals per EPA Methods 6010C and 7471. One (1) groundwater sample (DPT-09) was submitted for volatile organics analysis per EPA Method 8260 and semi-volatile analysis per EPA Method 8270.

A total of 10 soil samples and one (1) groundwater sample were submitted to SGS North America Inc. (NC Certification # 481). Chain of Custody documentation is included in Appendix C.

3.0 RESULTS

Results of Schnabel's geophysical investigation were submitted directly to NCDOT and a copy is provided in Appendix A. Schnabel's investigation did not reveal geophysical anomalies at the site indicative of underground storage tanks (USTs).

Sandy clay / clayey sand soils with varying amounts of silt were encountered across the project site. No petroleum odors were noted in the borings. The DPT-01 boring was terminated in damp soils at 16 feet below land surface (BLS). The DPT-02 through DPT-06 borings were terminated in damp soils at approximately eight (8) feet BLS. Borings DPT-07, DPT-08, and DPT-10 were terminated at four (4) feet BLS and moist to wet soils were encountered at two (2) to four (4) feet BLS. The DPT-09 was advanced into wet soils encountered approximately eight (8) feet deep and terminated at 10 feet BLS. Complete boring logs are provided in Appendix A.

Summarized soil sample analytical results are provided on Tables 1 and 2. Summarized groundwater sample analytical results are provided on Table 3. Boring logs including USCS information and OVA screening results are provided in Appendix B. Sample locations and estimated extent of impacted soils are illustrated on Figure 2. The complete analytical report is provided in Appendix C.

Results of OVA headspace screening ranged from zero to five (5) parts per million (see Boring Logs). No detectable concentrations of EPA Method 8270 compounds were revealed in any of the soil samples. Minor concentrations of numerous EPA Method 8260 compounds were detected but none were above the lowest corresponding standards (NCDENR MSCCs or NC IHSB SRGs and PRGs).

No metals were detected per EPA Methods 6010C and 7471 above the established standards except Arsenic concentrations in the samples collected from borings DPT-06, DPT-07, and DPT-09. The Arsenic results in these samples were just above the NC IHSB PSRG of 4.4 milligrams per kilogram (mg/Kg) but below the NC IHSB SRG of 5.4 mg/Kg and ranged from 4.62 in the DPT-06 (4-6') sample to 4.72 mg/Kg in the DPT-07 (2-4') sample.

There is no established NC IHSB SRG for Chromium and Mercury. These two (2) metals were detected in all soil samples but at concentrations well below the corresponding NC IHSB PSRG. For reference purposes, the Chromium and Mercury results were also well below the EPA Protection of Groundwater Maximum Contaminant Level Site Screening Levels of 180,000 mg/Kg and 0.1 mg/Kg, respectively.

The DPT-09 groundwater sample results did not reveal any EPA Method 8260 or 8270 compound concentrations above the laboratory quantitation limits or 2L GWQS. Minor, estimated concentrations below the quantitation limits but above the method detection limit for 4-Isopropyltoluene, Methylene Chloride, and Toluene were detected.

4.0 SUMMARY AND DISCUSSION

A preliminary site assessment was conducted at the subject site as requested by NCDOT. Planned construction features included a drainage feature across the site. A geophysical investigation did not reveal subsurface anomalies indicative of underground storage tanks.

Ten soil borings were advanced across the site for soil sample collection and laboratory analysis. One grab groundwater sample was collected from the DPT-09 boring in the proposed drainage feature area.

Sandy / clayey soils with varying silts were encountered during boring advancement. No analyzed compounds were detected above the established MSCCs or SRGs except Arsenic concentrations above the NC IHSB PSRG in the samples collected from borings DPT-06, DPT-07, and DPT-09. The potential source of Arsenic is unknown and could be naturally occurring; however, no background samples were collected during this investigation.

A grab groundwater sample collected from the DPT-09 boring did not reveal volatile or semi-volatile organic compound concentrations above the corresponding 2L GWQS. The grab groundwater sample was not analyzed for metals due the potential of false positive results related to turbidity of grab groundwater samples.

Based on the laboratory results indicating Arsenic concentrations in soil along the proposed drainage feature at borings DPT-07 and DPT-09 above the NC IHSB PSRG, soils near DPT-07 and DPT-09 may need to be considered impacted if disturbed during roadway construction activities. Appropriate health and safety measures should be followed to ensure worker safety during any construction activities involving disturbed soils in these areas.

According to the ditch detail on Plan Sheet 24 (Detail AD) provided by NCDOT, the proposed drainage feature is one (1) foot deep and four (4) feet wide at the base with a 3:1 slope. The calculated drainage feature area is seven (7) square feet. Based on assumed impacted soil extending from DPT-07 west to the property line (approximately 15 feet) and east, half way to DPT-08 (approximately 50 feet) approximately 17 cubic yards of arsenic impacted soil may be encountered during excavating for drainage feature construction near DPT-07 and need to be handled as potentially impacted waste. Based on assumed impacted soil extending from DPT-09 west half way to DPT-08

(approximately 50 feet) and east, half way to DPT-10 (approximately 45 feet) approximately 25 cubic yards of arsenic impacted soil may be encountered during excavating for drainage feature construction near DPT-09 and need to be handled as potentially impacted waste.

An estimated total of 42 cubic yards of impacted soil may be encountered during drainage feature construction activities near DPT-07 and DPT-09. During excavation activities, these soils should be handled to ensure worker safety and properly stockpiled for subsequent composite sampling and pending disposal determination. Composite sampling results may indicate soils could be utilized within the property for fill or require treatment/off-site disposal.

Arsenic impacted soils were also detected at the DPT-06 boring that was advanced on the east side of the former meat packing plant and out side the proposed right-of-way and easement. Per NCDOT, additional borings were not installed nearby for delineating purposes. The DPT-06 (4-6') soil sample revealed 4.62 mg/Kg Arsenic, which is just above the NC IHSB PSRG of 4.4 mg/Kg. An impacted volume estimated has not been calculated in this area; however, widespread Arsenic impacted soils are not suspected.

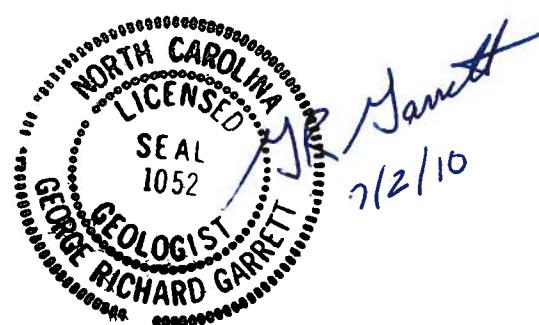

5.0 LIMITATIONS

This report is based on the agreed work scope and a review of available data from limited sampling. It is possible that this investigation may have failed to reveal the presence of contamination in the project area where such contamination may exist. Although CATLIN has used accepted methods appropriate for soil and groundwater sampling, CATLIN cannot guarantee that additional soil and/or groundwater contamination does not exist.

County: Brunswick
Description: US 17 – Wilmington Bypass

Subject: **Project 09210013.23, Report on Geophysical Surveys**
Parcel 59A, Navassa, North Carolina

Dear Mr. Garrett:

SCHNABEL ENGINEERING SOUTH, PC (Schnabel) is pleased to present this report on the geophysical surveys we conducted on the subject property. We understand this letter report will be included as an appendix in your report to the NCDOT. The report includes two 11x17 color figures and two 8.5x11 color figures.

INTRODUCTION

The work described in this report was conducted on April 19 and 20, 2010, by Schnabel under our 2009 contract with the NCDOT. The proposed survey areas were not accessible upon our arrival at the site due to tall, thick vegetation. After discussions with Catlin and the NCDOT, our original scope was modified to add clearing of the area around the building for the EM61 survey and to delete the EM31 survey of the area to the west of the road. Pictures of the site before and after the clearing was completed are shown on Figure 1.

The work was conducted within the accessible areas of a 30-foot wide perimeter around the main building as indicated by Catlin to support their environmental assessment of Parcel 59A (D&G Properties of Wilmington, LLC). The purpose of the geophysical surveys was to locate possible metal underground storage tanks (UST's) and associated metal product lines in the accessible areas of the proposed survey area.

The geophysical investigation consisted of electromagnetic (EM) induction surveys using a Geonics EM61-MK2 instrument. The EM61 metal detector is used to locate metal objects buried up to about eight feet below ground surface. Ground-penetrating radar (GPR) investigations of selected EM61 anomalies were conducted using a Geophysical Survey Systems SIR-3000 system equipped with a 400 MHz antenna. Photographs of the equipment used are shown on Figure 2.

FIELD METHODOLOGY

Locations of geophysical data points were obtained using a sub-meter Trimble Pro-XRS DGPS system. References to direction and location in this report are based on the US State Plane 1983 System, North Carolina 3200 Zone, using the NAD 83 datum, with units in US survey feet. The locations of existing site features (building, metallic objects, trees, etc.) were recorded for later correlation with the geophysical data and for location references to the NCDOT drawings.

The EM61 data were collected along parallel survey lines spaced approximately 2.5 feet apart. The EM61 and DGPS data were recorded digitally using a field computer and later transferred to a desktop computer for data processing. The GPR data were collected along survey lines spaced one to two feet apart in two orthogonal directions over anomalous EM readings not attributed to cultural features. The GPR data were reviewed in the field to evaluate the possible presence of UST's. The GPR data also were recorded digitally and later transferred to a desktop computer for further review.

Preliminary results for Parcel 59A were sent to Ben Ashba and Richard Garrett of Catlin and Terry Fox of the NCDOT on May 21, 2010.

DISCUSSION OF RESULTS

The contoured EM61 data for Parcel 59A are shown on Figures 3 and 4. The EM61 early time gate results are plotted on Figure 3. The early time gate data provide the more sensitive detection of metal objects. Figure 4 shows the difference between the response of the top and bottom coils of the EM61 instrument (differential response). The difference is taken to remove the effect of surface and very shallowly buried metallic objects. Typically, the differential response emphasizes anomalies from deeper and larger objects such as UST's.

The early time gate and differential results show anomalies apparently caused by buried utilities or known site features (Figures 3 and 4). The GPR data collected over selected differential EM61 anomalies do not indicate the presence of metallic UST's within the accessible portions of the survey area (Figures 3 and 4).

CONCLUSIONS

Our evaluation of the geophysical data collected on Parcel 59A on Project R-2633B in Navassa, NC indicates the following:

The geophysical data do not indicate the presence of metallic UST's in the areas surveyed on Parcel 59A.

LIMITATIONS

These services have been performed and this report prepared for the North Carolina Department of Transportation in accordance with generally accepted guidelines for conducting geophysical surveys. It is generally recognized that the results of geophysical surveys are non-unique and may not represent actual subsurface conditions.

We appreciate the opportunity to have provided these services. Please call if you need additional information or have any questions.

Sincerely,

SCHNABEL ENGINEERING SOUTH, PC

Jeremy S Strohmeyer, LG
Project Manager

Note: The contour plot shows the earliest and most sensitive time gate of the EM61 bottom coil/channel in millivolts (mV). The EM data were collected on May 19 and 20, 2010, using a Geonics EM61-MK2 instrument. Positioning for the EM61 survey was provided using a submeter Trimble ProXRS DGPS system. Coordinates are in the US State Plane 1983 System, North Carolina Zone 3200, using the NAD 1983 datum. GPR data were acquired on May 20, 2010, using a Geophysical Survey Systems SIR 3000 equipped with a 400 MHz antenna.

LABORATORY REPORT AND CHAIN OF CUSTODY RECORD

Ben Ashba
Richard Catlin & Associates
P.O. Box 10279
Wilmington, NC 28404-0279

Report Number: G128-2537

Client Project: NCDOT US 17 ILM Bypass Parcel #59A

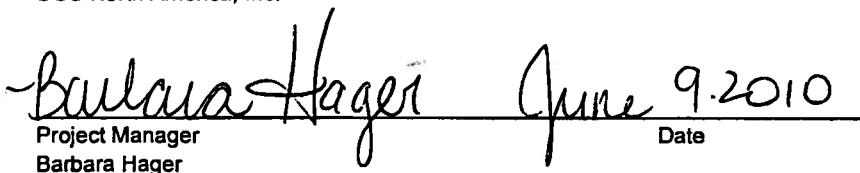

Dear Ben Ashba,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America, Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America, Inc.

Barbara Hager June 9, 2010

Date

Case Narrative
Catlin
SGS Project: G128-2537
Project Name: NCDOT US 17 ILM Bypass Parcel #59A

SGS North America Inc.

June 15th, 2010

- Ten soil samples were accepted into the laboratory on May 28th, 2010 at 1100 for analyses as indicated on the chain of custody. The samples were received in good condition, with a temperature of 5.7°C.
- All extractions and analyses were completed within holding time limits, with the following quality control exceptions.

8260 Analyses

- Methylene Chloride was detected in the associated trip blank below the reporting limit, but above the method detection limit. It was detected in the samples at similar concentrations. This compound is a common laboratory solvent and its detection may be due to the background concentration found in the trip blank.

List of Reporting Abbreviations
And Data Qualifiers

B = Compound also detected in batch blank

BQL = Below Quantification Limit (RL or MDL)

DF = Dilution Factor

Dup = Duplicate

D = Detected, but RPD is > 40% between results in dual column method.

E = Estimated concentration, exceeds calibration range.

J = Estimated concentration, below calibration range and above MDL

LCS(D) = Laboratory Control Spike (Duplicate)

MDL = Method Detection Limit

MS(D) = Matrix Spike (Duplicate)

PQL = Practical Quantitation Limit

RL/CL = Reporting Limit / Control Limit

RPD = Relative Percent Difference

UJ = Target analytes with recoveries that are $10\% < \%R < LCL$; # of MEs are allowable and compounds are not detected in the sample.

mg/kg = milligram per kilogram, ppm, parts per million

ug/kg = micrograms per kilogram, ppb, parts per billion

mg/L = milligram per liter, ppm, parts per million

ug/L = micrograms per liter, ppb, parts per billion

% Rec = Percent Recovery

% soilds = Percent Solids

Special Notes:

- 1) Metals and mercury samples are digested with a hot block; see the standard operating procedure document for details.
- 2) Uncertainty for all reported data is less than or equal to 30 percent.

**Results for Volatiles

Barium	15.7	11.3	1.26	1	MG/KG	6010C	6/5/2010	
Cadmium	0.486	1.13	0.0915	1	MG/KG	6010C	6/5/2010	JB
Chromium	4.45	1.13	0.135	1	MG/KG	6010C	6/5/2010	
Lead	12.1	1.13	0.701	1	MG/KG	6010C	6/5/2010	
Mercury	0.00829	0.0210	0.00121	1	MG/KG	7471	6/3/2010	J
Selenium	BQL	2.26	0.640	1	MG/KG	6010C	6/5/2010	
Silver	0.755	1.13	0.104	1	MG/KG	6010C	6/5/2010	JB

Comments

BQL = Below Quantitation Limits

DF = Dilution Factor

J = Between MDL and RL

B= Amount in Prep Blank > MDL
