CAUTION NOTICE

THE SUBSURFACE INFORMATION AND THE SUBSURFACE INVESTIGATION ON WHICH IT IS BASED WERE MADE FOR THE PURPOSE OF STUDY, PLANNING, AND DESIGN, AND NOT FOR CONSTRUCTION OR PAY PURPOSES. THE VARIOUS FIELD BORING LOGS, ROCK CORES, AND SOIL TEST DATA AVAILABLE MAY BE REVIEWED OR INSPECTED IN RALEIGH BY CONTACTING THE N. C. DEPARTMENT OF TRANSPORTATION, GEOTECHNICAL ENGINEERING UNIT AT (919) 250-4088. NEITHER THE SUBSURFACE PLANS AND REPORTS, NOR THE FIELD BORING LOGS, ROCK CORES, OR SOIL TEST DATA ARE PART OF THE CONTRACT.

GENERAL SOIL AND ROCK STRATA DESCRIPTIONS AND INDICATED BOUNDARIES ARE BASED ON A GEOTECHNICAL INTERPRETATION OF ALL AVAILABLE SUBSURFACE DATA AND MAY NOT NECESSARILY REFLECT THE ACTUAL SUBSURFACE CONDITIONS BETWEEN BORINGS OR BETWEEN SAMPLED STRATA WITHIN THE BOREHOLE. THE LABORATORY SAMPLE DATA AND THE IN SITU (IN-PLACE) TEST DATA CAN BE RELIED ON ONLY TO THE DEGREE OF RELIABILITY INHERENT IN THE STANDARD TEST METHOD. THE OBSERVED WATER LEVELS OR SOIL MOISTURE CONDITIONS INDICATED IN THE SUBSURFACE INVESTIGATIONS ARE AS RECORDED AT THE TIME OF THE INVESTIGATION. THESE WATER LEVELS OR SOIL MOISTURE CONDITIONS MAY VARY CONSIDERABLY WITH TIME ACCORDING TO CLIMATIC CONDITIONS INCLUDING TEMPERATURES, PRECIPITATION, AND WIND, AS WELL AS OTHER NON-CLIMATIC FACTORS.

THE BIDDER OR CONTRACTOR IS CAUTIONED THAT DETAILS SHOWN ON THE SUBSURFACE PLANS ARE PRELIMINARY ONLY AND IN MANY CASES THE FINAL DESIGN DETAILS ARE DIFFERENT. FOR BIDDING AND CONSTRUCTION PURPOSES, REFER TO THE CONSTRUCTION PLANS AND DOCUMENTS FOR FINAL DESIGN INFORMATION ON THIS PROJECT. THE DEPARTMENT DOES NOT WARRANT OR GUARANTEE THE SUFFICIENCY OR ACCURACY OF THE INVESTIGATION MADE, NOR THE INTERPRETATIONS MADE, OR OPINION OF THE DEPARTMENT AS TO THE TYPE OF MATERIALS AND CONDITIONS TO BE ENCOUNTERED. THE BIDDER OR CONTRACTOR IS CAUTIONED TO MAKE SUCH INDEPENDENT SUBSURFACE INVESTIGATIONS AS HE DEEMS NECESSARY TO SATISFY HIMSELF AS TO CONDITIONS TO BE ENCOUNTERED ON THIS PROJECT. THE CONTRACTOR SHALL HAVE NO CLAIM FOR ADDITIONAL COMPENSATION OR FOR AN EXTENSION OF TIME FOR ANY REASON RESULTING FROM THE ACTUAL CONDITIONS ENCOUNTERED AT THE SITE DIFFERING FROM THOSE INDICATED IN THE SUBSURFACE INFORMATION.

SOIL AND ROCK LEGEND, TERMS, SYMBOLS, AND ABBREVIATIONS

SOIL DESCRIPTION

SOIL IS CONSIDERED TO BE THE UNCONSOLIDATED, SEMI-CONSOLIDATED, OR WEATHERED EARTH MATERIALS THAT CAN BE PENETRATED WITH A CONTINUOUS FLIGHT POWER AUGER, AND YIELD LESS THAN 100 BLOWS PER FOOT ACCORDING TO STANDARD PENETRATION TEST (AASHTO T206, ASTM D-1586). SOIL CLASSIFICATION IS BASED ON THE AASHTO SYSTEM. BASIC DESCRIPTIONS GENERALLY SHALL INCLUDE: CONSISTENCY, COLOR, TEXTURE, MOISTURE, AASHTO CLASSIFICATION, AND OTHER PERTINENT FACTORS SUCH AS MINERALOGICAL COMPOSITION, ANGULARITY, STRUCTURE, PLASTICITY, ETC. EXAMPLE:

VERY STIFF, GRAY, SILTY CLAY, MOIST WITH INTERBEDDED FINE SAND LAYERS, HIGHLY PLASTIC, A-7-6

SOIL LEGEND AND AASHTO CLASSIFICATION

GENERAL CLASS.	GRANULAR MATERIALS (≤ 35% PASSING #200)							SILT-CLAY MATERIALS (> 35% PASSING #200)				ORGANIC MATERIALS

SOIL MOISTURE - CORRELATION OF TERMS

SOIL MOISTURE SCALE (ATTERBERG LIMITS)	FIELD MOISTURE DESCRIPTION	GUIDE FOR FIELD MOISTURE DESCRIPTION
	- SATURATED - (SAT.)	USUALLY LIQUID; VERY WET, USUALLY FROM BELOW THE GROUND WATER TABLE
LL — LIQUID LIMIT		
PLASTIC RANGE (PI)	- WET - (W)	SEMISOLID; REQUIRES DRYING TO ATTAIN OPTIMUM MOISTURE
PL — PLASTIC LIMIT		
OM — OPTIMUM MOISTURE	- MOIST - (M)	SOLID; AT OR NEAR OPTIMUM MOISTURE
SL — SHRINKAGE LIMIT		
	- DRY - (D)	REQUIRES ADDITIONAL WATER TO ATTAIN OPTIMUM MOISTURE

PLASTICITY

	PLASTICITY INDEX (PI)	DRY STRENGTH
NONPLASTIC	0-5	VERY LOW
LOW PLASTICITY	6-15	SLIGHT
MED. PLASTICITY	16-25	MEDIUM
HIGH PLASTICITY	26 OR MORE	HIGH

COLOR

DESCRIPTIONS MAY INCLUDE COLOR OR COLOR COMBINATIONS (TAN, RED, YELLOW-BROWN, BLUE-GRAY). MODIFIERS SUCH AS LIGHT, DARK, STREAKED, ETC. ARE USED TO DESCRIBE APPEARANCE.

GRADATION

WELL GRADED - INDICATES A GOOD REPRESENTATION OF PARTICLE SIZES FROM FINE TO COARSE.
UNIFORM - INDICATES THAT SOIL PARTICLES ARE ALL APPROXIMATELY THE SAME SIZE. (ALSO POORLY GRADED)
GAP-GRADED - INDICATES A MIXTURE OF UNIFORM PARTICLES OF TWO OR MORE SIZES.

ANGULARITY OF GRAINS

THE ANGULARITY OR ROUNDNESS OF SOIL GRAINS IS DESIGNATED BY THE TERMS: ANGULAR, SUBANGULAR, SUBROUNDED, OR ROUNDED.

MINERALOGICAL COMPOSITION

MINERAL NAMES SUCH AS QUARTZ, FELDSPAR, MICA, TALC, KAOLIN, ETC. ARE USED IN DESCRIPTIONS WHENEVER THEY ARE CONSIDERED OF SIGNIFICANCE.

COMPRESSIBILITY

SLIGHTLY COMPRESSIBLE	LIQUID LIMIT LESS THAN 31
MODERATELY COMPRESSIBLE	LIQUID LIMIT EQUAL TO 31-50
HIGHLY COMPRESSIBLE	LIQUID LIMIT GREATER THAN 50

PERCENTAGE OF MATERIAL

ORGANIC MATERIAL	GRANULAR SOILS	SILT - CLAY SOILS	OTHER MATERIAL	
TRACE OF ORGANIC MATTER	2 - 3%	3 - 5%	TRACE	1 - 10%
LITTLE ORGANIC MATTER	3 - 5%	5 - 12%	LITTLE	10 - 20%
MODERATELY ORGANIC	5 - 10%	12 - 20%	SOME	20 - 35%
HIGHLY ORGANIC	>10%	>20%	HIGHLY	35% AND ABOVE

GROUND WATER

- WATER LEVEL IN BORE HOLE IMMEDIATELY AFTER DRILLING
- STATIC WATER LEVEL AFTER 24 HOURS
- PW — PERCHED WATER, SATURATED ZONE, OR WATER BEARING STRATA
- SPRING OR SEEP

MISCELLANEOUS SYMBOLS

- ROADWAY EMBANKMENT (RE) WITH SOIL DESCRIPTION
- SOIL SYMBOL
- ARTIFICIAL FILL (AF) OTHER THAN ROADWAY EMBANKMENT
- INFERRED SOIL BOUNDARY
- INFERRED ROCK LINE
- ALLUVIAL SOIL BOUNDARY
- 25/025 — DIP & DIP DIRECTION OF ROCK STRUCTURES
- SOUNDING ROD
- SPT CPT DPT DMT VST PMT — TEST BORING
- AUGER BORING
- CORE BORING
- MW — MONITORING WELL
- PIEZOMETER INSTALLATION
- SLOPE INDICATOR INSTALLATION
- SPT N-VALUE
- REF — SPT REFUSAL

SAMPLE DESIGNATIONS
S - BULK SAMPLE
SS - SPLIT SPOON SAMPLE
ST - SHELBY TUBE SAMPLE
RS - ROCK SAMPLE
RT - RECOMPACTED TRIAXIAL SAMPLE
CBR - CALIFORNIA BEARING RATIO SAMPLE

ABBREVIATIONS

AR - AUGER REFUSAL
BT - BORING TERMINATED
CL. - CLAY
CPT - CONE PENETRATION TEST
CSE. - COARSE
DMT - DILATOMETER TEST
DPT - DYNAMIC PENETRATION TEST
e - VOID RATIO
F - FINE
FOSS. - FOSSILIFEROUS
FRAC. - FRACTURED, FRACTURES
FRAGS. - FRAGMENTS
HI. - HIGHLY
MED. - MEDIUM
MICA. - MICACEOUS
MOD. - MODERATELY
NP - NON PLASTIC
ORG. - ORGANIC
PMT - PRESSUREMETER TEST
SAP. - SAPROLITIC
SD. - SAND, SANDY
SL. - SILT, SILTY
SLI. - SLIGHTLY
TCR - TRICONE REFUSAL
- MOISTURE CONTENT
V - VERY
VST - VANE SHEAR TEST
WEA. - WEATHERED
γ - UNIT WEIGHT
γ_d - DRY UNIT WEIGHT

ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FEET
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	> 4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.
EXTREMELY INDURATED	SHARP HAMMER BLOWS REQUIRED TO BREAK SAMPLE; SAMPLE BREAKS ACROSS GRAINS.

TERMS AND DEFINITIONS

ALLUVIUM (ALLUV.) - SOILS THAT HAVE BEEN TRANSPORTED BY WATER.

AQUIFER - A WATER BEARING FORMATION OR STRATA.

ARENACEOUS - APPLIED TO ROCKS THAT HAVE BEEN DERIVED FROM SAND OR THAT CONTAIN SAND.

ARGILLACEOUS - APPLIED TO ALL ROCKS OR SUBSTANCES COMPOSED OF CLAY MINERALS, OR HAVING A NOTABLE PROPORTION OF CLAY IN THEIR COMPOSITION, AS SHALE, SLATE, ETC.

ARTESIAN - GROUND WATER THAT IS UNDER SUFFICIENT PRESSURE TO RISE ABOVE THE LEVEL AT WHICH IT IS ENCOUNTERED, BUT WHICH DOES NOT NECESSARILY RISE TO OR ABOVE THE GROUND SURFACE.

CALCAREOUS (CALC.) - SOILS THAT CONTAIN APPRECIABLE AMOUNTS OF CALCIUM CARBONATE.

COLLUVIUM - ROCK FRAGMENTS MIXED WITH SOIL DEPOSITED BY GRAVITY ON SLOPE OR AT BOTTOM OF SLOPE.

CORE RECOVERY (REC.) - TOTAL LENGTH OF ALL MATERIAL RECOVERED IN THE CORE BARREL DIVIDED BY TOTAL LENGTH OF CORE RUN AND EXPRESSED AS A PERCENTAGE.

DIKE - A TABULAR BODY OF IGNEOUS ROCK THAT CUTS ACROSS THE STRUCTURE OF ADJACENT ROCKS OR CUTS MASSIVE ROCK.

DIP - THE ANGLE AT WHICH A STRATUM OR ANY PLANAR FEATURE IS INCLINED FROM THE HORIZONTAL.

DIP DIRECTION (DIP AZIMUTH) - THE DIRECTION OR BEARING OF THE HORIZONTAL TRACE OF THE LINE OF DIP, MEASURED CLOCKWISE FROM NORTH.

FAULT - A FRACTURE OR FRACTURE ZONE ALONG WHICH THERE HAS BEEN DISPLACEMENT OF THE SIDES RELATIVE TO ONE ANOTHER PARALLEL TO THE FRACTURE.

FISSILE - A PROPERTY OF SPLITTING ALONG CLOSELY SPACED PARALLEL PLANES.

FLOAT - ROCK FRAGMENTS ON SURFACE NEAR THEIR ORIGINAL POSITION AND DISLODGED FROM PARENT MATERIAL.

FLOOD PLAIN (FP) - LAND BORDERING A STREAM, BUILT OF SEDIMENTS DEPOSITED BY THE STREAM.

FORMATION (FM.) - A MAPPABLE GEOLOGIC UNIT THAT CAN BE RECOGNIZED AND TRACED IN THE FIELD.

JOINT - FRACTURE IN ROCK ALONG WHICH NO APPRECIABLE MOVEMENT HAS OCCURRED.

LEDGE - A SHELF-LIKE RIDGE OR PROJECTION OF ROCK WHOSE THICKNESS IS SMALL COMPARED TO ITS LATERAL EXTENT.

LENS - A BODY OF SOIL OR ROCK THAT THINS OUT IN ONE OR MORE DIRECTIONS.

MOTTLED (MOT.) - IRREGULARLY MARKED WITH SPOTS OF DIFFERENT COLORS. MOTTLING IN SOILS USUALLY INDICATES POOR AERATION AND LACK OF GOOD DRAINAGE.

PERCHED WATER - WATER MAINTAINED ABOVE THE NORMAL GROUND WATER LEVEL BY THE PRESENCE OF AN INTERVENING IMPERVIOUS STRATUM.

RESIDUAL (RES.) SOIL - SOIL FORMED IN PLACE BY THE WEATHERING OF ROCK.

ROCK QUALITY DESIGNATION (RQD) - A MEASURE OF ROCK QUALITY DESCRIBED BY TOTAL LENGTH OF ROCK SEGMENTS EQUAL TO OR GREATER THAN 4 INCHES DIVIDED BY THE TOTAL LENGTH OF CORE RUN AND EXPRESSED AS A PERCENTAGE.

SAPROLITE (SAP.) - RESIDUAL SOIL THAT RETAINS THE RELIC STRUCTURE OR FABRIC OF THE PARENT ROCK.

SILL - AN INTRUSIVE BODY OF IGNEOUS ROCK OF APPROXIMATELY UNIFORM THICKNESS AND RELATIVELY THIN COMPARED WITH ITS LATERAL EXTENT, THAT HAS BEEN EMPLACED PARALLEL TO THE BEDDING OR SCHISTOSITY OF THE INTRUDED ROCKS.

SLICKENSIDE - POLISHED AND STRIATED SURFACE THAT RESULTS FROM FRICTION ALONG A FAULT OR SLIP PLANE.

STANDARD PENETRATION TEST (PENETRATION RESISTANCE) (SPT) - NUMBER OF BLOWS (N OR BPF) OF A 140 LB. HAMMER FALLING 30 INCHES REQUIRED TO PRODUCE A PENETRATION OF 1 FOOT INTO SOIL WITH A 2 INCH OUTSIDE DIAMETER SPLIT SPOON SAMPLER. SPT REFUSAL IS PENETRATION EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS.

STRATA CORE RECOVERY (SREC.) - TOTAL LENGTH OF STRATA MATERIAL RECOVERED DIVIDED BY TOTAL LENGTH OF STRATUM AND EXPRESSED AS A PERCENTAGE.

STRATA ROCK QUALITY DESIGNATION (SRQD) - A MEASURE OF ROCK QUALITY DESCRIBED BY TOTAL LENGTH OF ROCK SEGMENTS WITHIN A STRATUM EQUAL TO OR GREATER THAN 4 INCHES DIVIDED BY THE TOTAL LENGTH OF STRATA AND EXPRESSED AS A PERCENTAGE.

TOPSOIL (TS.) - SURFACE SOILS USUALLY CONTAINING ORGANIC MATTER.

STATE PROJECT: 34542.1.2 (R-3421C)
FEDERAL PROJECT: NHF-220(4)
COUNTY: Richmond
DESCRIPTION: US 220 BYPASS FROM 0.2 MILES SOUTHWEST OF SR 1304 (HARRINGTON ROAD), TO US 220 BUSINESS/BYPASS INTERCHANGE SOUTH OF ELLERBE

SUBJECT: Geotechnical Report – Inventory

PROJECT DESCRIPTION

The R-3421C project is a combination of new alignment, and widening that will connect the new U.S.220 Ellerbe bypass with the new Rockingham Bypass, (R-3421A). When the R-3421 projects are complete they will be part of the new Interstate Highway, I-73, between Wilmington and Greensboro, utilizing and improving parts of U.S. 220, and U.S. 74, and incorporating new alignment as well.

This R-3421C report describes a project that will include 3.7 miles of new divided interstate highway, most with 1 or two parallel service roads. Two interchanges, each with 1 new bridge, provide access to existing roads. The bridge over the South Prong to Cartledge Creek will be widened. Up to 50' of cut is required at -Y8- and –L- in the new alignment connecting to R-3421B. The widening sections are generally limited to around 20 feet of cut.

The field investigation was conducted from August 2005 to October 2005, using a CME-550 drill machine with an automatic hammer. Standard Penetration Tests, (SPT), were performed at selected locations, through hollow stem augers and additional borings were advanced using solid continuous flight augers. Representative soil samples were collected and forwarded to the Materials and Tests Unit laboratory for soil quality analysis, moisture content and ASTM classification.

The reader is expected to make his or her own judgement of the sufficiency of the data underpinning any particular geologic interpretation within this report, and the validity of the interpretation. All available drillholes are plotted on the plan view and also appear projected into the profiles.

The following alignments, totaling 8.27 miles, were investigated.

AREAS OF SPECIAL GEOTECHNICAL INTEREST

Highly plastic clays: Soil with plasticity indices equal to or greater than 28, were found in the following areas. The highest PI soil is near the basal contact of the coastal plain unit, usually on the coastal plain side of the contact.

The following intervals were found to have PI values commonly above PI=28

	Line	Station

PHYSIOGRAPHY AND GEOLOGY

Physiography

This R-3421C project is located where the Coastal Plain physiographic province meets the Piedmont physiographic provinces. The Coastal Plain province has sand or very sandy soil and extends from this area to the Atlantic coastal area. Relief decreases from the 200' from creek to ridge here, to 5 or 10' at the coast. The Piedmont province is almost all residual soil that is dissected by streams, with increasing relief from this area northwest to the mountainous Blue Ridge province. In the project area streams such as the South Prong to Cartledge Creek, have cut through the Coastal Plain sand to the residual soil typical of the Piedmont below.

Geology

Throughout North Carolina the geologic provinces run northeast – southwest. In this area, we will encounter part of the Triassic basins, the Slate Belt, and the Coastal Plain. The Wadesboro Basin is an area of Triassic age silt stone that has filled in a fault-bounded northeast trending basin, that is bordered to the northwest and southeast by Paleozoic age rock. Beyond the Paleozoic rock to the southeast, Cretaceous age sand covers the older rock, and in turn, the Cretaceous age sand is covered in places by Tertiary age sand.

This project runs generally north so it traversing the geology at an oblique angle. More specifically, the road begins in the Cretaceous and Tertiary age sand and then as the road descends into the South Prong Valley, it crosses an area of Triassic rock interpreted to be a small basin, parallel to the larger Wadesboro basin, the Ellerbe Basin. When the road climbs out of the low place, the sandy stratigraphy is again encountered.

This terminology, Paleozoic, Triassic, Cretaceous, and Tertiary refers to rock age. The bedrock types can also be distinguished by rock type, for instance, slate, granite, siltstone, etcetera. The important thing is that soils are formed from these rocks, and the soil characteristics are strongly influenced by the original rock type.

Soil Properties

The units that appear on the Geologic Map of North Carolina, (1985), that occur within the project are described below.

Soil mapped as Tp: There is a soil type, the Pinehurst Formation that is mapped north of Ellerbe, and as described, matches soil found in the project area. It is sandy soil, A-2-4 or A-1 loose, without much clay or silt, and is considered to be a windblown deposit. It occurrs on the ridge tops and drapes down the hill slopes. Usually it is less than 5' thick.

Soil mapped as Tt: The soil mapped as Tt, Tertiary terrace deposits occurs on the "A" and "B" sections of the project. It is mostly a red clayey or sandy unit with quartz cobble beds. It was not encountered on the "C" section of roadway. An equivalent age unit may be directly under the Tp in places.

Soil mapped as Km: The mapped extent of the "Km" soil, the Middendorf formation, probably includes areas that are actually Cape Fear formation, and possibly other Cretaceous and Tertiary age deposits. The lowermost sandy unit in this area is white, slightly micaceous, usually with weathered feldspar showing up as kaolin clay. This fits the Cape Fear description fairly well. Above this unit, there is the indication of a persistent less clayey sandy unit, usually gray or red.

3F

Residual soil mapped as CSph$_1$: An occurrence of residual soil derived from rock type CSph$_1$ near the beginning of the project, was found only in drill holes. The rock is mapped as metamorphosed slate belt rock has PI values of PI=40 and greater.

Residual soil mapped as TRC: The soil mapped as TRC on the project corridor lies in the area adjacent to the stream known as South Prong to Cartledge Creek. This rock is poorly indurated sediment and may break down where it is exposed to weathering. Drill samples from this material found the silt constituent above 30%.

Residual soil mapped as Czmd: The soil mapped as Czmd is the "normal" slatebelt rock that is found under most of Union County. The physical properties of the soil are similar to the slate belt soil on the other side of the Triassic rock. That is: high PI, high percentage of clay, low percentage of silt.

Rock Properties

No in-place rock was identified within the limits of this project. Intervals of N=100 or greater were encountered, but were not above grade.

Groundwater Properties

There are four recognized aquifer systems in North Carolina's Coastal Plain region[1], and two of them will be encountered in this project. The Surficial Aquifer is nothing more than the permeable soil between land surface and the first impermeable layer. Standing water far above the residual contact at around 310' elevation is evidence of this aquifer, which is probably local in scope. The Cretaceous Aquifer is the contact zone of the lowermost Cretaceous strata and the underlying bedrock aquifer. On this project it is seen in the borings that show a static water table in the lower Coastal Plain soil, above the Residual soil.

GEOTECHNICAL DESCRIPTIVE ANALYSIS

The project covers about 3.7 miles of interstate highway partly on a new location and partly as road widening, with two interchanges. For descriptive purposes, the project has been divided into 3 segments.

Segment 1: South of South Prong Drainage: covers the –L- alignment, the Y9 alignment, the interchanges and all related roads from the beginning up to –L- 460+00, the edge of the "South Prong to Cartledge Creek" drainage.

Segment 2: South Prong Drainage: covers the drainage feature from –L-460+00 to –L- 540+00

Segment 3: North of South Prong Drainage: covers the –L- and all other roads and structures north and east of the Cartledge Creek drainage, from –L-540+00 to the end at –L-551+61, including parts of SR-2 and SR-5.

[1] Ground Water in the Coastal Plain of North Carolina: http://www.bae.ncsu.edu/programs/extension/publicat/wqwm/ag450

3-G

Segment 1: South of South Prong Drainage
Coastal Plain Sand

Physical Description
The limits of this segment were established to reflect the geologic conditions. It covers all of the interchange between U.S. 220 and the new U.S. 220 Rockingham Bypass. It also covers the –L- alignment where it travels through the interchange that will provide local access to Haywood Cemetery Road, Dockery Road and the future service roads from Ellerbe.

This segment is mapped in plan on sheets 4 through 12, 20 through 25. and profile sheets 27 through 33, and sheet 40, through 58, and sheets 67 through 69. The –L- alignment begins at station 355, elevation 400, descends to elevation 365 at station 384, then climbs to the interchange with the future improved U.S. 220, at elevation 400' at station 404. Beyond station 404, the project is a widening project and the alignment is referenced to north bound and southbound lanes. It climbs through the interchange to elevation 420 at station 414. From station 414 the lanes descend to elevation 360 at station 436, then climb to elevation 400 at station 458, then descend to the end of the segment at station 460 and elevation 395.

Geology
This segment is all covered by Coastal Plain sandy soil, above the residual soil contact at about 360' elevation. Most of the sand at the surface is tan loose sand, most likely Pinehurst formation. This sand is generally less than 10' thick and covers the more clayey Coastal Plain sand. Within this segment sandy formations are found from 440' elevation to 330' elevation, a 110' thick package of clay, sand and sandy clay. In the drill data, there is the suggestion of persistent layering but the data is open to multiple interpretations.

Cuts and Fills
The best portrayal of the cuts and fills in this segment of the project appear on sheets 27 through 33, and sheet 40, through 58, and sheets 67 through 69, the profile sheets. The most significant cuts are in the vicinity of the –L- / -Y9- interchange, which is almost all on new alignment.

Soil
The soil encountered in this project is either residual soil, (created by weathering rock), or sedimentary soil, (deposited by wind or water), or artificial fill, (soil moved, usually by mechanical means and not compacted to a known specification). The residual soil, a weathering product of granite, gabbro, or metamorphic rock, is usually clayey or silty soil. All sedimentary soil is lumped together as alluvial Coastal Plain soil.

Coastal Plain Soil
The Coastal Plain Soil is mostly sandy clay or clayey sand with a lower elevation limit of around 350' elevation above sea level, and a maximum of about 440' elevation above sea level for a total of 100' thick more or less.

There are areas of the segment that consistently have high PI values, and others that consistently have low clay content. It was not possible to resolve these occurrences into an overall pattern that would predict, for instance, the PI of the soil based on elevation.

Rock
No rock or weathered rock was found on this project.[2]

Groundwater
Our drilling in the Coastal Plain sediment section found water above grade from –L-360+00 to 372+00, possibly as a perched aquifer.

Wetlands
This segment contains all of the identified wetlands. They occur related to topographic lows on sheets 4,5,6,7,9,10,20,21,23,and 24. Among the criteria for determining the boundaries of a wetland is the persistent presence of water near ground surface. This water can be "perched", resting on impermeable, soil, or it can be the exposed top of the bedrock aquifer. In this case, because the wetlands are all within the coastal plain sand section, the wetlands indicate the existence of areas of high PI, impermeable soil, and a perched aquifer.

Segment 2.South Prong of Cartledge Creek valley, from –L-460+00 to –L-540+00

Physical Description
This segment of the job is a road-widening project. This segment appears on plan sheets 11 through 17, and profile sheets 33 through 39, 51, 52, 59, 60, 61, 62, 63, 64, 65, and 66. The finished grade will drop from 460' elevation at the beginning, to prong Creek at at –L-510',elevation305', then climb to elevation 410' at –L-540+00, the end of the segment. The segment lies entirely within the South Prong valley, and follows the path of the existing road.

Geology
The limits of this segment were set at the limits of residual soil. The valley of the South Prong of Cartledge Creek has residual soil exposed in the slopes or barely covered by a thin veneer of wind-blown sand. Except at the beginning or end of this segment, the underlying rock is Triassic age Sedimentary rock of the Newark Supergroup. This material often loses strength and weathers rapidly when used in a roadway embankment. The upper elevation of the residual soil is at about 360' elevation.

Cuts and Fills
This entire segment is a road-widening project. The surface for the profile sheets was "cut" at the center of the existing roadway, so planned cuts or fills are indicated where the borings appear to be underground or floating in the air.

Soil
This segment is mostly residual soil, though at each end, alluvial Coastal Plain sediment is exposed. The residual soil samples have a silt content of 30 to 40% relative to the coastal plain with less than 10% silt. In this case, the silt content is a good guide to the presence of residual soil.
Residual Soil from Phyllite: From –L-460+00 to –L-475+00, and –L-536+00 to –L-546+00, borings at the brow of the slope found phyllite weathered to very stiff residual soil, covered by a veneer of coastal plain sand. At the contact between the water-lain sand and the residual soil, PI values of 40 to 51 are found in the proposed subgrade. At elevations below this contact the PI values in residual soil are 15 to 20.
Residual Soil from Triassic rock: From –L-475+00, and –L-579+00, The soil is derived from Triassic age material. The silt content ranges from 35 to 45%. PI values of 20 to 30 are common.

[2] Values of N> 100 were returned from hard sedimentary clay beds, and from gravel layers.

3 H

Groundwater
No groundwater was identified in this segment.

Wetlands
There are small wetland areas along the persistent streams listed below.

Wet weather and persistent streams
The following locations are topographic lows that channel water all or part of the year.

Drainage Locations	-L-510+00 (South Prong to Cartledge Creek.

Segment 3.
This segment covers –L from 274 +00 to the end at –L-355+00 including the interchange and auxiliary or access roads. Besides being "everything else" on a construction basis, this segment is characterized by light colored coastal plain sediments that have a marine origin. The project appears in plan on sheets 15 through19, 22, and 23 and in profile on sheets 34 through 40, and 48 through 56.

Alignment	Type of work	
-L-	Widening	540+00 to 551+00
SR-4	New Alignment	100+00 to 128+00
-SR-5-	New Alignment	100+00 to 127+00

Physical Description
The finished grade of this segment of 'L' begins at about elevation 410 and gradually climbs to elevation 425 at the end at –L-551+00. (Plan sheets 18, 19, 26 and profile sheets 38, 39, 62, and 63.

Soil
The segment is underlain by Coastal plain soil.
Residual Soil: The finished grade comes close to residual soil, but no residual soil was found above planned grade.
Coastal Plain Soil: Most of the Coastal Plain soil is A-7-6 or A-6 clayey sand that is probably of marine origin.

Groundwater
Groundwater was not measured in any of the borings.

Wetlands
No wet lands were identified.
