## **PRELIMINARY SITE ASSESSMENT REPORT**

**3026 Old Cullowhee Road (SR 1002)  
Bob Wheatley Property, Parcel 015  
Cullowhee, North Carolina  
State Project B-4159, WBS Element #33507.1.1  
Jackson County**

### **Executive Summary**

The subject site is the Bob Wheatley property (Parcel 015) located at 3026 Old Cullowhee Road (SR 1002) in Cullowhee, North Carolina. The primary purpose of this investigation was to evaluate the presence or absence of underground storage tanks (USTs) and constituents of concern in soil within the North Carolina Department of Transportation (NCDOT) existing and proposed Rights-of-Way (ROWs) and easements fronting Parcel 015, as a result of previous and/or current operations at the subject site.

Parcel 015 is located adjacent to and between Parcels 013 and 017 and extends to the west, where it borders the Tuckasegee River. It contains an apartment building near the front of the property and a single-family residence in the rear portion of the property. The investigation area for the preliminary site assessment for Parcel 015 was located within a small area fronting Old Cullowhee Road. The preliminary site assessment was conducted by GEL Engineering of NC, Inc. (GEL) in accordance with the Notice to Proceed issued by NCDOT on December 16, 2013.

The preliminary site assessment was conducted within the existing and proposed NCDOT ROWs and easements fronting Parcel 015 and included a geophysical investigation, and the collection and analysis of soil samples. No subsurface anomalies indicative of suspected or known USTs were identified, and it has been concluded that there are no USTs present within the existing or proposed ROWs or easements.

## **Executive Summary (continued)**

A soil sample was collected for analysis from one boring constructed within the preliminary site assessment investigation area. The soil sample was analyzed for DRO and GRO, and VOCs, and SVOCs. GRO was not detected in the sample, but DRO was detected by QROS at a level of 23 milligrams per kilogram (mg/kg), which exceeds the NDENR action level for DRO (10 mg/kg). Detection of the elevated DRO level indicates the possibility of soil impact from petroleum.

Based on the detection of elevated DRO concentration in one soil sample, it is estimated that there is an approximate total volume of 92 cubic yards of impacted soil (DRO >10 mg/kg) in the vicinity of boring S15-1.

No additional environmental investigation of the soil at the site by NCDOT is recommended at this time. However, it is recommended that soils excavated in the vicinity of boring S15-1 as part of planned construction activities by NCDOT be handled appropriately and further characterized for petroleum constituents, as needed.

**Jackson County**

### **1.0 Introduction**

This document presents the details of a geophysical survey and preliminary site assessment performed within the North Carolina Department of Transportation (NCDOT) existing and proposed Rights-of-Way (ROWs) and easements at the Bob Wheatley property (Parcel 015) located at 3026 Old Cullowhee Road (SR 1002) in Cullowhee, North Carolina.

Parcel 015 is located adjacent to and between Parcels 013 and 017 and extends to the west, where it borders the Tuckasegee River. It contains an apartment building near the front of the property and a single-family residence in the rear portion of the property. The site location is shown on Figure 1, an excerpt from the United States Geological Survey (USGS) 7.5-minute quadrangle map of Sylva South, North Carolina. The investigation area for the preliminary site assessment for Parcel 015 was located within the portion of the parcel with frontage on Old Cullowhee Road, as shown in Figure 2. The preliminary site assessment was conducted by GEL Engineering of NC, Inc. (GEL) in accordance with the Notice to Proceed issued by NCDOT on December 16, 2013.

The primary purpose of this investigation was to evaluate the presence or absence of underground storage tanks (USTs) and/or constituents of concern in soil within the NCDOT ROWs and proposed easements at the subject site as a result of current and/or former operations.

### **2.0 Background**

NCDOT is planning road improvements to the area in the vicinity of Old Cullowhee Road in Cullowhee, North Carolina. NCDOT wanted to assess the area in the ROW and proposed easements on the west side of Old Cullowhee Road fronting Parcel 015 to evaluate the presence or absence of USTs and soil contamination related to the current and/or former on-site operations, and the impact (if any) of these operations on the proposed road improvements. Figures 2 through 4 show the general site layout for Parcel 015.

There is currently no visible evidence of existing USTs or vents at the site, and representatives of the North Carolina Department of Environment and Natural Resources (NCDENR) Asheville District Office indicated that there are no files for the site in its database. No NCDENR UST Incident number or Facility ID number has been assigned to the property. However, adjacent Parcel 013 was previously assigned UST Incident No. 28651, which is no longer active.

A groundwater monitoring well was observed on Parcel 015, as shown on Figure 4, and is located within the preliminary site investigation area shown in Figure 2. GEL assigned an ID of MW15-1 to the well as part of preliminary assessment. Files in the NCDENR Asheville District Office for UST Incident No. 7281 (Parcel 011) indicated that this well was originally identified as well Q94a10, and was part of series of groundwater monitoring wells that were installed at properties located along Old Cullowhee Road by NCDENR approximately 20 to 25 years ago in an effort to locate the source of a petroleum-impacted groundwater contaminant plume that had impacted a drinking water well in Cullowhee. The most recent groundwater quality data reported for the well is provided in a 2002 report prepared by SEI, P.C. that indicates that the well was sampled in June 1999. The data for that sampling event indicate that benzene was the only constituent exceeding the NCDENR 2L standard. Benzene was detected at a level of 1.60 microgram per liter (ug/L), which slightly exceeds the NCDENR 2L standard of 1 mg/L. The well was dry when SEI, P.C. attempted to sample it in April 2002, and is currently inaccessible. Northing and Easting coordinates for the well are listed in the table in Section 4.2 of this report.

### 3.0 Local Geology and Surroundings

Parcel 015 is located in a developed area of Cullowhee in Jackson County, North Carolina. Surrounding land uses include residential and commercial activities.

This area is located in the Blue Ridge Belt within the Blue Ridge Physiographic of North Carolina. The land surface of the area is characterized by mountainous terrain. The Blue Ridge Belt is typified by a complex of sedimentary, metamorphic, and igneous rocks, including felsic gneiss and granite that are Late Proterozoic in age. The Cullowhee area is located adjacent to and within the Tuckasegee River floodplain.

The United States Department of Agriculture's *Web Soil Survey* (2014) (<http://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx>) maps the native soil in the investigation area as "Braddock-Urban Land Complex" (BrC), which is characterized as stream terraces consisting of clay and clay loam derived from old alluvium. The soils encountered at the site during the preliminary site assessment consisted predominantly of red sandy silt and silty clay.

Groundwater was not encountered in the boring constructed at the site as part of the preliminary site assessment. Previous depth to groundwater measurements made in monitoring wells located in the Cullowhee area indicate the water table in the area of the site is typically located at depths of at least 10 to 20 feet below ground surface (bgs). Based on the USGS topographic map presented as Figure 1, the site is located approximately 2100 feet above mean sea level. The topography in Figure 1 indicates that groundwater in the vicinity of Parcel 015 most likely flows in a westerly direction towards the Tuckasegee River.

#### **4.0 Subsurface Investigation**

To evaluate the presence or absence of USTs and/or impact to subsurface soil within the NCDOT ROW and proposed easements for Parcel 015, GEL performed a limited site assessment that consisted of the following tasks:

- Performance of a geophysical investigation to identify the presence or absence of USTs and associated appurtenances within the northerly ROW and proposed easements of Old Cullowhee Road fronting Parcel 015.
- Soil vapor screening of soil samples collected from one subsurface soil boring located within the northerly ROW and proposed easements of Old Cullowhee Road fronting Parcel 015 to evaluate the potential presence or absence of soil impact from petroleum constituents of concern.
- Collection and laboratory analysis of a soil sample from the subsurface soil boring.

The details of these tasks are discussed in the following sections.

##### **4.1 Geophysical Survey**

The geophysical survey included the deployment of ground penetrating radar (GPR) technology and time domain electromagnetic technology (TDEM) to the site. These

technologies were used in concert with one another in order to identify subsurface metallic anomalies and, more specifically, to identify the potential presence of USTs within the investigation area. A brief description of each technology is presented in the following paragraphs followed by a discussion of the results of the geophysical investigation.

#### **4.1.1 Ground Penetrating Radar Methodology**

A RAMAC digital radar control system configured with a 250 Megahertz (MHz) antenna array was used in this investigation. GPR is an electromagnetic geophysical method that detects interfaces between subsurface materials with differing dielectric constants. The GPR system consists of an antenna that houses the transmitter and receiver, a digital control unit that both generates and digitally records the GPR data, and a color video monitor to view data as they are collected in the field.

The transmitter radiates repetitive short-duration electromagnetic waves (at radar frequencies) into the earth from an antenna moving across the ground surface. These radar waves are reflected back to the receiver from the interface of materials with different dielectric constants. The intensity of the reflected signal is a function of the contrast in the dielectric constant between the materials, the conductivity of the material through which the wave is traveling, and the frequency of the signal. Subsurface features that commonly cause such reflections are: 1) natural geologic conditions, such as changes in sediment composition, bedding, and cementation horizons and voids; or 2) unnatural changes to the subsurface, such as disturbed soils, soil backfill, buried debris, tanks, pipelines, and utilities. The digital control unit processes the signal from the receiver and produces a continuous cross-section of the subsurface interface reflection events.

GPR data profiles are collected along transects, which are measured paths along which the GPR antenna is moved. During a survey, marks are placed in the data by the operator at designated points along the GPR transects or with a survey wheel odometer. These marks allow for a correlation between the GPR data and the position of the GPR antenna on the ground.

Depth of investigation of the GPR signal is highly site-specific and is limited by signal attenuation (absorption) in the subsurface materials. Signal attenuation is dependent

on the electrical conductivity of the subsurface materials. Signal attenuation is greatest in materials with relatively high electrical conductivities, such as clays, brackish groundwater, or groundwater with a high dissolved solid content from natural or man-made sources. Signal attenuation is lowest in relatively low-conductivity materials, such as dry sand or rock. Depth of investigation is also dependent on the antenna's transmitting frequency. Depth of investigation generally increases as transmitting frequency decreases; however, the ability to resolve smaller subsurface features is diminished as frequency is decreased.

The GPR antenna used at this site is internally shielded from aboveground interference sources. Accordingly, the GPR response is not affected by overhead power lines, metallic buildings, or nearby objects.

#### **4.1.2 Time Domain Electromagnetic Methodology**

The TDEM methods measure the electrical conductivity of subsurface materials. The conductivity is determined by inducing (from a transmitter) a time or frequency-varying magnetic field and measuring (with a receiver) the amplitude and phase shift of an induced secondary magnetic field. The secondary magnetic field is created by subsurface conductive materials behaving as an inductor as the primary magnetic field is passed through them.

The Geonics EM-61 system used in this investigation operates within these principles. However, the EM-61 TDEM system can discriminate between moderately conductive earth materials and very conductive metallic targets. The EM-61 consists of a portable coincident loop time domain transmitter and receiver with a 0.5-meter by 1.0-meter coil system. The EM-61 generates 150 pulses per second and measures the response from the ground after transmission or between pulses. The secondary EM responses from metallic targets are of longer duration than those created by conductive earth materials. By recording the later time EM arrivals, only the response from metallic targets is measured, rather than the field generated by the earth material.

#### **4.1.3 Field Procedures**

The GPR and TDEM field investigation was performed on December 17, 2013, within the existing and proposed ROWs and easements fronting Parcel 015, as shown in Figure 3. A GPR system time range setting of 90 nanoseconds (ns) was used during the entire

investigation. This range was determined after a series of test lines were conducted to evaluate the GPR response in the local geologic section. Interpretation of the GPR data was conducted in the field and any potential anomalies were marked in the field. GPR data processing typically included band pass filtering, background removal, horizontal smoothing, and gain adjustments. TDEM was also used to scan the project site. Any electromagnetic anomalies indicative of buried metallic objects were marked in the field.

It should be noted that NC 811 underground utility locations had been performed within the investigation area at Parcel 015 prior to the initiation of the preliminary site assessment field activities at the site and were marked with paint.

The TDEM and GPR data did not indicate the presence of "Known USTs," "Probable USTs," or "Possible USTs" in the subsurface of the investigation area. Additionally, there was no visual evidence of USTs in the investigation area. The red area shown within the Parcel 015 investigation area on Figure 3 is an EM-61 signature caused by a steel manhole cover, and is not indicative of an underground anomaly.

#### **4.2 Subsurface Soil Investigation**

To evaluate the presence or absence of impact to subsurface soil by constituents of concern, GEL collected soil samples from one subsurface soil boring, S15-1 at Parcel 015 on December 17, 2013, for analysis of total petroleum hydrocarbon indicator parameters. The soil borings were constructed within the westerly ROW and proposed easements of Old Cullowhee Road, as shown on Figure 4. The northing and easting coordinates for the boring location are listed in the table below.

**Summary of Location Data and PID Measurements for Soil Samples  
Collected for Analysis and Existing Monitoring Well at Parcel 019**

<b>Soil Boring</b>	<b>Depth Interval of Soil Sample Collected for Analysis (feet bgs)</b>	<b>PID Reading (ppm)</b>	<b>Northing</b>	<b>Easting</b>
S15-1	7-8	0.0	596653.340	754291.688
<b>Monitoring Well</b>				
MW15-1	N/A	N/A	596660.126	754284.548

Notes:

- 1) Northings and Eastings are based on the NC State Plane Coordinate System
- 2) bgs = below ground surface
- 3) PID = photoionization detector
- 4) ppm = parts per million

Boring S15-1 was advanced to a total depth of 8 feet bgs. Soil samples were collected at depths of 3-4 feet and 7-8 feet from the borehole. Both soil samples were inspected for indications of impact by constituents of concern, including petroleum hydrocarbons, such as odors, discoloration, or visible sheen. This sampling was accomplished using DPT provided by Regional Probing. Soil boring lithologic logs are attached as Appendix II of this document. Groundwater was not encountered in any borings.

The soil samples were screened for the presence of organic vapors using a portable photoionization detector (PID). The PID measures the concentration of organic compounds in the vapor space above a soil sample resulting from volatilization of organic compounds contained in the soil. To screen the soils, each sample was placed in a clean, resealable polyethylene bag. The bag was sealed, and the sample was allowed to equilibrate for approximately 5 minutes, after which time a small opening was made in the bag. The probe of the PID was then inserted into the bag, and the airspace above the soil was screened for organic vapors.

No organic vapor concentrations were measured in either of the soil screening samples collected from the two borings. Therefore, to assess the subsurface soil quality, the soil sample collected at a depth of 7-8 feet bgs from boring S15-1 was designated for analysis. One-half of the designated soil sample was submitted to each of two separate laboratories for analysis.

Following completion of the soil sampling activities, the boring was abandoned by filling the borehole with soil cuttings and hydrated bentonite. Splits for the soil sample were submitted to QROS' analytical laboratory affiliate (KB Labs, Inc.) in Gainesville, Florida for analysis of petroleum hydrocarbon constituents using Ultra-violet Fluorescence Spectrometry. A soil sample split was also submitted to Pace Analytical Services, Inc. (Pace) in Huntersville, North Carolina for analysis of volatile organic compounds (VOCs) by EPA Method 8260B and semi-volatile organic compounds (SVOCs) by EPA Method 8270D, since possible soil impact from released solvents was suspected due to an auto repair operation that was previously conducted on adjacent Parcel 013. The analytical results are included on the Certificates of Analysis provided in Appendix III, and a summary of the analytical results is presented in Table 1. The QROS results indicate that GRO was not detected in the soil sample. However, a concentration of 23 milligrams per kilogram (mg/kg) DRO was reported for the sample, which exceeds the NCDENR action level for DRO (10 mg/kg). No VOCs or SVOCs were detected in the soil sample by Pace.

The detection of DRO in sample S15-1 at a level exceeding the NCDENR action level indicates that soil in the vicinity of the soil boring may be impacted by petroleum. It is estimated that there is an approximate total volume of 92 cubic yards of impacted soil (DRO >10 mg/kg) in the vicinity of boring S15-1 based on the following assumed area within the investigation area (as shown on Figure 4) and assumed depth of impacted soil:

#### Boring S15-1 Area

$$312 \text{ square feet} \times 8 \text{ feet} = 92 \text{ cubic yards}$$

## 5.0 Conclusions and Recommendations

GEL performed a preliminary site assessment within the NCDOT westerly ROW and proposed easements fronting Parcel 015 that included a geophysical investigation, and the collection and analysis of soil samples. No subsurface anomalies indicative of suspected or known USTs were identified within the investigation area, and it has been concluded that there are no USTs present within the westerly existing and proposed ROWs and proposed easements adjacent to the site.

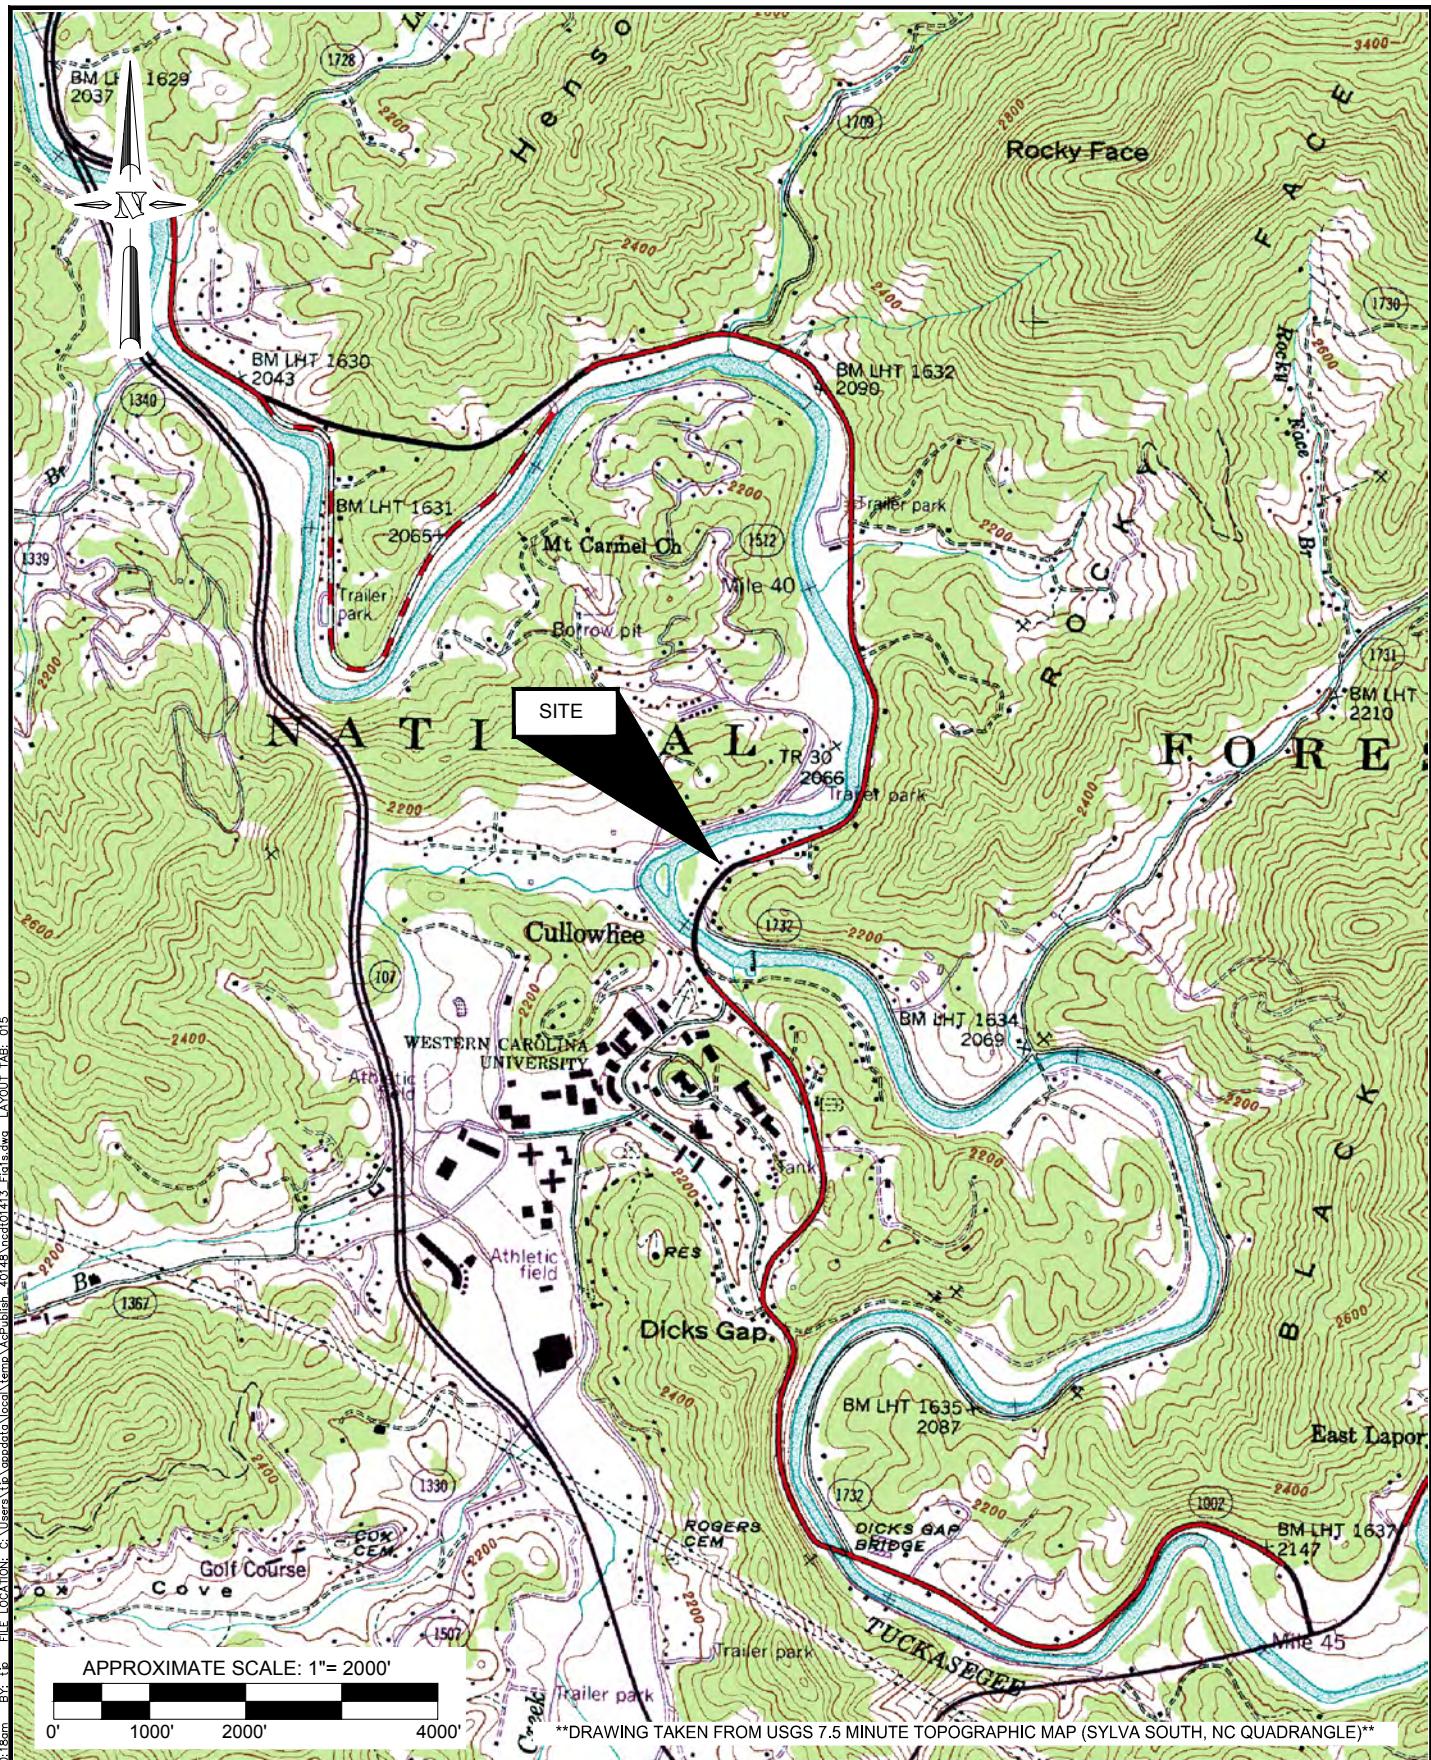

A soil sample was collected for analysis from one boring constructed within the preliminary site assessment investigation area. The soil sample was analyzed for DRO and GRO, and VOCs and SVOCs. GRO was not detected in the sample, but DRO was detected by QROS at a level of 23 mg/kg, which exceeds the NDENR action level for DRO (10 mg/kg). Detection of the elevated DRO level indicates the possibility of soil impact from petroleum.

Based on the detection of elevated an DRO concentration in the soil sample collected in the Parcel 015 investigation area, it is estimated that there is an approximate total volume of 92 cubic yards of impacted soil (DRO >10 mg/kg) in the vicinity of boring S15-1.

No additional environmental investigation of the soil at the site by NCDOT is recommended at this time. However, it is recommended that soils excavated in the vicinity of boring S15-1 as part of planned construction activities by NCDOT be handled appropriately and further characterized for petroleum constituents, as needed.

**TABLE 1**  
**SUMMARY OF ANALYTICAL RESULTS FOR COLLECTED SOIL SAMPLES**

**Preliminary Site Assessment**  
**Parcel 015, 3026 Old Cullowhee Road**  
**Cullowhee, Jackson County, North Carolina**  
**State Project No. B-4159, WBS Element #33507.1.1**

Sample ID	Diesel Range Organics (DRO)		Gasoline Range Organics (GRO)		QROS Analytical Results					Pace Analytical Results	
	QROS	Pace	QROS	Pace	BTEX (C6-C9)	TPH (C5-C35)	Total Aromatics (C10-C35)	16 EPA PAHs	Benzo(a)pyrene	VOCs	SVOCs
S15-1	23	NA	< 0.5	NA	< 0.5	23	17.5	0.4	< 0.027	ND	ND
<b>NCDENR Action Level</b>	10	10	10	10							
<b>NCDENR MSCC</b>										0.096	

**Notes:**

- 1) All reported values are shown in milligrams per kilogram (mg/kg).
- 2) MSCC = NCDENR's Maximum Soil Contaminant Concentration Levels (April 2012); MSCC shown is the lowest of established Residential Soil Cleanup Levels and Soil-to Groundwater Maximum Contaminant Concentration shown in the NCDENR MSCC Table for any given constituent.
- 3) NA = Not analyzed
- 4) ND = No VOCs/SVOCs detected above the Method Detection Limit.
- 5) Reported values exceeding corresponding NCDENR Action Levels or MSCCs are highlighted in yellow.

## **APPENDICES**

**APPENDIX I**  
**PHOTOGRAPHS**

Photograph 1: Aerial view showing boring location S15-1 and existing monitoring well MW15-1 on Parcel 015. West is at the top of photo (aerial is from Google Earth).

**APPENDIX II**

**SOIL BORING LITHOLOGIC LOGS**

## SOIL BORING LOG

Boring/Well No.: **S15-1**

Date Started: 12/17/13

Date Completed: 12/17/13

No.	Depth Interval	Blow Counts	PID (ppm)	Soil Description	Soil Type
1	0.0' – 2.5'	--	--	Red Clay; Moist; Cohesive, tight clay; Asphalt/gravel 0'-0.5'	CL
2	2.5' – 4.0'	--	0.0	Red/Brown Sandy Silt with Gravel; Moist; River rock, rounded quartz	ML
3	4.0' – 8.0'	--	0.0	Red Silt with Sand; Moist; rounded quartz	ML
4					
5				Total depth = 8 feet below land surface	
6					
7					
8					
9					
10					

Notes:

- 1) 4-foot continuous cores using DPT.
- 2) PID readings shown are for discrete samples collected at depth intervals of 3'– 4', and 7'– 8'

RE: Project: NCDT01413 WBS33507.1.1  
Pace Project No.: 92184006

Dear Andrew Eyer:

Enclosed are the analytical results for sample(s) received by the laboratory on December 19, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

Analyses were performed at the Pace Analytical Services location indicated on the sample analyte page for analysis unless otherwise footnoted.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Angela Baioni

## QUALIFIERS

Project: NCDT01413 WBS33507.1.1

Pace Project No.: 92184006

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Acid preservation may not be appropriate for 2-Chloroethylvinyl ether, Styrene, and Vinyl chloride.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### LABORATORIES

PASI-C Pace Analytical Services - Charlotte

### ANALYTE QUALIFIERS

- 1g The internal standard response is below criteria. No hits associated with this internal standard. Results unaffected by high bias.
- 2g This flag applies to all compounds with RPD greater than 30%.
- A+ The reaction of the soil preservative, sodium bisulfate, is known to react with humic acid in soils to produce ketones. Based upon method blank results, the laboratory feels the ketones in this sample are a result of that reaction.
- IO The internal standard response was outside the laboratory acceptance limits confirmed by reanalysis. The results reported are from the most QC compliant analysis.
- L2 Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- R1 RPD value was outside control limits.
- S0 Surrogate recovery outside laboratory control limits.
- S2 Surrogate recovery outside laboratory control limits due to matrix interferences (confirmed by similar results from sample re-analysis).
