FAYETTEVILLE, CUMBERLAND COUNTY, NORTH CAROLINA**

EXECUTIVE SUMMARY OF RESULTS

Pyramid Environmental & Engineering P.C. (Pyramid) has prepared this Preliminary Site Assessment (PSA) report documenting background information, field activities, assessment activities, findings, conclusions, and recommendations for Parcel 025, Tally Investments, LLC. The purpose of this assessment was to determine the presence or absence of underground storage tanks (USTs) and impacted soils at the subject property within the proposed right-of-way (ROW) and/or easement and edge of pavement (State Project B-4490). The PSA was conducted with particular attention to the areas to be cut as indicated by slope stake lines and cross sections or to be excavated for the installation of drainage features. This preliminary site assessment was conducted on behalf of the North Carolina Department of Transportation (NCDOT) in accordance with Pyramid's December 20, 2013, technical proposal.

The following statements summarize the results of the PSA:

- **Site History:** A review of the North Carolina Department of Environment and Natural Resources (DENR) registered UST database and incident database indicated no environmental incidents were on file for the Tally Investments, LLC property (Parcel 025). On January 23, 2014, Pyramid emailed the Cumberland County B-4490 parcel addresses to Mr. James Brown, the Fayetteville Regional Incident Manager for the DENR UST Section, with a request to investigate any environmental incidents associated with the parcels. On January 24, 2014, Mr. Brown responded to the email and stated that site address 460 W. Rowan St. (Parcel 025) does not have any environmental incidents in the DENR database.

On January 20, 2014, Pyramid Project Manager Eric Cross performed a site visit at the property. The property was an active auto repair and body shop, and the buildings on the site left very little open space to perform the PSA. Mr. Cross interviewed the tenant operating the auto repair shop, Mr. Eric Cruz. Mr. Cruz indicated that he had been operating the shop for approximately 4 years, and that to his knowledge the property had operated as an auto repair shop since the 1960's. He indicated that the northern of the two structures has been added approximately 15 years prior to our investigation. He was not aware of any USTs at the property.

- **Geophysical Survey:** The geophysical investigation did not record evidence of any metallic USTs at the property. However, it should be noted that only a small portion of the property was surveyed due to the buildings and parked vehicles on-site. Additionally, the extensive metal across the site (buildings, vehicles, and fences) prevented EM61 data from being collected.
- **Limited Soil Assessment:** It should be noted that, congruent to the limited geophysical survey, the majority of the property was inaccessible due to the buildings which occupied most of the parcel. Boring locations were chosen based primarily on access.

A total of three borings were performed across the property. The QED results did not detect TPH-GRO or TPH-DRO concentrations above 10 milligrams per kilogram (mg/kg) in any of the soil samples analyzed.

One sample from each boring was sent to the laboratory for analysis of soils using EPA Methods 8260/8270 for volatile and semi-volatile organic compounds based on the site usage history. The laboratory results did not detect any volatile or semi-volatile organic compounds above detection limits.

- **Limited Groundwater Assessment:** Soil boring 25-3 was converted into a 1-inch diameter temporary monitoring well to a total depth of 14 feet below land surface (BLS). The depth-to-groundwater was measured at 9.9 feet BLS. The laboratory analysis did not detect concentrations of any compounds above detection limits.

Review of the NCDOT engineering plans indicates that the NCDOT may encounter groundwater at the property during construction activities. However, no evidence of contamination was observed in the water samples collected during this investigation.

- **Impacted Soils:** No impacted soils were observed at the property therefore, no calculations or recommendations are required for this parcel. It should be noted that, if impacted soil is encountered during road construction outside the area analyzed by this investigation, the impacted soil should be managed according to NC DENR Division of Waste Management (DWM) UST Section Guidelines and disposed of at a permitted facility.

1.0 Introduction

Pyramid Environmental & Engineering P.C. (Pyramid) has prepared this Preliminary Site Assessment (PSA) report documenting background information, field activities, assessment activities, findings, conclusions, and recommendations for Parcel 025, Tally Investments, LLC. The Tally Investments, LLC property is currently an automobile repair facility located approximately at 460 W. Rowan St., Fayetteville, NC. This preliminary site assessment was conducted on behalf of the North Carolina Department of Transportation (NCDOT) in accordance with Pyramid's December 20, 2013, technical proposal.

The purpose of this assessment was to determine the presence or absence of underground storage tanks (USTs) and the potential for impacted soils at the subject properties across the entire site in anticipation of a total take (State Project B-4490). The location of the subject site is shown on **Figure 1**.

1.1 Background Information

Based on the NCDOT's December 13, 2013, *Request for Technical and Cost Proposal*, the PSA was conducted within all accessible areas of the property in anticipation of a total take, with emphasis on the areas to be cut as indicated by slope stake lines and cross sections or to be excavated for the installation of drainage features and/or other utilities, in accordance with the CADD files provided to Pyramid by the NCDOT. The PSA included the following:

- Research the properties for past uses and possible releases.
- Conduct a preliminary geophysical site assessment and limited soil assessment in all accessible areas of the property in anticipation of a total take with emphasis on the areas to be cut as indicated by slope stake lines and cross sections or to be excavated for the installation of drainage features and/or other utilities.
- Should groundwater be encountered at a depth that might impact the NCDOT construction activities, report the depth to groundwater for that site and attempt to obtain one groundwater sample for laboratory analysis by installing a temporary monitoring well.

1.2 Project Information

Prior to field activities, a Health and Safety Plan was prepared. Prior to drilling activities, the public underground utilities were located and marked by the North Carolina One-Call Service. A private utility locator, Northstate Utility Locating Incorporated of Colfax, North Carolina was used to mark the on-site private, buried utilities.

2.0 Site History

The NCDOT description of the parcel in the RFP provided to Pyramid on December 13, 2013, provided the following background information related to the site:

"Currently this facility operates as an automobile repair and body shop. The site is located approximately 100 ft. east of the intersection of Hillsboro St. and W. Rowan St. No known NC DENR UST Section Facility Identification Numbers or Groundwater Incidents Identification Numbers associated with this property. No evidence of USTs was observed during a site visit on April 30, 2009. Investigate the entire parcel as a total take is anticipated."

Pyramid completed a records review of the parcel, interviewed DENR personnel, interviewed property tenants, and reviewed aerial photographs to assess past uses of the property. Pyramid reviewed historical aerial photographs dating back to 1960 available from the Cumberland County Soil and Water Conservation office in Fayetteville and on Google Earth for past uses. The 1960, 1966, 1972, 1993, 2003, 2009, 2010, and 2011 aerial photographs are included in **Appendix A**. Historical information reviewed as part of the PSA indicated that building on the property was constructed sometime between 1960 and 1966. The first aerial photograph to clearly show the building was the 1966 aerial. The 1960 aerial depicted the site to be largely covered in trees. The adjacent property to the east contained a similar-sized structure that was visible on the 1960, 1966, and 1972 aerials. This building was then demolished sometime between 1972 and 1993.

City directories dated 1937, 1951, 1957, 1963, 1968, 1973, 1980, 1985, 1990, 1995, to 2000 were reviewed at the Cumberland County Public Library in Fayetteville, North Carolina. The table below includes a list of the building or subject property occupants from 1937 to 2000 based on the city directory review.

Year	Occupant
1937	No Listing
1951	Reinecke Tarlton Inc. General Contractor
1957	Newsome Tarlton Inc. Building Contractors
1963	Tarlton Construction Company/Kish Radio & TV Repair
1968	Tarlton Construction Company/Cape Fear Realty Brokerage Company
1973	Cape Fear Realty Brokerage Company
1980	Vacant
1985	Vacant
1990	Custom Marble Kitchen & Bath, Inc.
1995	Vacant
2000	J&C Auto Sales

The above listings indicate that the property has operated as a variety of different commercial entities in the past, including general contractors, real estate, TV repair, a kitchen and bath store, and more recently an auto sales company.

On January 23, 2014, Pyramid emailed the Cumberland County B-4490 parcel addresses to Mr. James Brown, the Fayetteville Regional Incident Manager for the DENR UST Section, with a request to investigate any environmental incidents associated with the parcels. On January 24, 2014, Mr. Brown responded to the email and stated that site address 460 W. Rowan St. (Parcel 025) does not have any environmental incidents in the DENR database.

On January 20, 2014, Pyramid Project Manager Eric Cross performed a site visit at the property. The property was an active auto repair and body shop, and the buildings on the site left very little open space to perform the PSA. Mr. Cross interviewed the tenant operating the auto repair shop, Mr. Eric Cruz. Mr. Cruz indicated that he had been operating the shop for approximately 4 years, and that to his knowledge the property had operated as an auto repair shop since the 1960's. He indicated that the northern of the two structures has been added approximately 15 years prior to our investigation. He was not aware of any USTs at his property.

3.0 Geophysical Investigation

Pyramid performed a ground penetrating radar (GPR) survey across the accessible portions of the Parcel. An EM survey was not performed due to the very limited access and abundant metal interference (buildings, vehicles, fences). All accessible areas of the parcel were surveyed by the GPR, and no large structures were identified. Isolated zones of possible debris and suspected utilities were identified by the GPR.

The geophysical investigation did not record evidence of any metallic USTs at the property. However, it should be noted that only a small portion of the property was surveyed due to the buildings and parked vehicles on-site. Additionally, the extensive metal across the site (buildings, vehicles, and fences) prevented EM61 data from being collected.

The full details of the geophysical investigation are included in the Geophysical Investigation Report as **Appendix B**.

4.0 Soil Sampling Activities & Results

4.1 Soil Assessment Field Activities

On February 17, 2014, Pyramid mobilized to the site and drilled soil borings, installed one temporary monitoring well, and collected some of the proposed soil samples for the PSA. The soil borings and temporary well (TW) were completed using a track mounted Geoprobe® Direct-Push rig. Three (3) soil borings (25-1, 25-2, and 25-3) were advanced on the subject property. The selected locations were chosen to avoid public utilities along the adjacent roads and private utilities associated with the business while remaining in the proposed right of way and/or easement. The soil borings were installed adjacent to proposed drainage piping, as indicated by the NCDOT engineering plans, or within the proposed ROW and/or easement to obtain additional information. The locations of the borings are shown on **Figure 2**.

Soil samples were continuously collected in four-foot long disposable sleeves from each boring for geologic description, and visual examination for signs of contamination. Soil recovered from each sleeve was screened in the field using a Photo-Ionization Detector (PID) approximately every 2 feet depending on the soil recovery of each sleeve. In general, the soil sample with the highest PID reading was selected from each boring for laboratory analysis. If field screening detected an elevated reading, then additional soil samples from each boring were selectively analyzed with the QED UVF HC-1 Analyzer. The soil boring logs with the soil descriptions, visual examination, and PID screening results are included in **Appendix C**. The PID field screening results are summarized in **Table 1**. To prevent cross contamination, new disposable nitrile gloves were worn by the sampling technician during the sampling activities, and were changed between samples. No odors were detected in the borings during the field screening.

The soil samples selected for Total Petroleum Hydrocarbon (TPH) analyses were analyzed utilizing the QED UVF HC-1 Analyzer system from QROS-US. The NCDOT has indicated that this instrument is an acceptable method to provide total petroleum hydrocarbon (TPH) results for soil analysis for the PSA projects. Pyramid's QED-certified technician performed the soil analyses. The soil samples selected for analysis using the QED Analyzer were analyzed for TPH as diesel range organics (DRO) and TPH as gasoline range organics (GRO). The soil samples selected for analysis using the QED were preserved in the field with methanol and were analyzed at the end of each day using the QED.

In addition to the QED analysis, select samples were collected for more comprehensive laboratory analysis using EPA Methods 8260 and 8270 for volatile and semi-volatile organic compounds (VOCs and SVOCs). These additional analyses were performed based on the site history of the property, which suggested that other potential contaminants such as solvents from the auto repair facility may be present within the soils. In general, soils that exhibited the highest PID readings and were above the water

table were selected for the additional laboratory analyses. Specifically, samples 25-1(2-4), 25-2(4-6), and 25-3(4-6) were placed in laboratory prepared containers and shipped to Pace Analytical in Huntersville, NC for analysis of volatile and semi-volatile organic compounds.

4.2 Soil Sample Analytical Results

QED Results

The DENR action levels for both TPH-GRO and TPH-DRO are 10 mg/kg. The QED results did not detect TPH-GRO or TPH-DRO concentrations above 10 mg/kg in any of the soil samples analyzed. The soil sample QED results are summarized in **Table 2**. A copy of the QED analysis report is included in **Appendix D**.

Laboratory Analysis for VOCs and SVOCs

One sample from each boring [25-1(2-4), 25-2(4-6), and 25-3(4-6)] was sent to the laboratory for analysis of soils using EPA Methods 8260/8270 for volatile and semi-volatile organic compounds based on the site usage history. The laboratory results did not detect any volatile or semi-volatile organic compounds above detection limits. The soil sample VOC/SVOC laboratory results are summarized in **Table 3**. A copy of the laboratory report and chain-of-custody is included in **Appendix E**.

4.3 Temporary Monitoring Well Installation

On February 17, 2014, Pyramid converted soil boring 25-3 into a 1-inch diameter temporary monitoring well (TW). Soil boring 25-3(TW) was completed to a total depth of 14 feet below land surface (BLS). The temporary well was constructed with 4 feet of 1-inch diameter of schedule 80 PVC casing and 10 feet of 1-inch diameter of schedule 80 PVC slotted screen. The temporary well was set in the boring with 10 feet of slotted screen at the bottom of the well.

On February 17, 2014, the temporary monitoring well 25-3(TW) was gauged using a properly decontaminated electric water level probe. The depth-to-groundwater was measured at 9.9 feet BLS. The temporary monitoring well was sampled using a new 0.5-inch diameter disposable bailer. Upon completion of the gauging and sampling, the temporary monitoring well was properly abandoned by the drillers by removing the casing, and filling the borehole with bentonite chips and portland cement.

4.4 Groundwater Analytical Results

The groundwater sample 25-3(TW) was placed in laboratory prepared containers for analysis of volatile organic compounds (VOCs) using EPA Method 6200B and semi-volatile organic compounds (SVOCs) using EPA Method 625. The samples were shipped to Pace Analytical in Huntersville, NC. The laboratory analysis did not detect concentrations of any compounds above laboratory detection limits. The groundwater results for sample 25-3(TW) are summarized in **Table 4**. A copy of the laboratory report and chain-of-custody is included in **Appendix E**.

5.0 Conclusions and Recommendations

As requested by NCDOT, Pyramid has completed a PSA at the Tally Investments, LLC property located 460 W. Rowan St., Fayetteville, NC (Parcel 025). The following is a summary of the assessment activities and results. Personnel logs for all field work are included in **Appendix F**.

5.1 Geophysical Investigation

The geophysical investigation provided no evidence of metallic USTs within the existing and proposed ROW and/or easement. It should be noted that an EM survey was not performed due to access limitations and significant metal interference. The GPR survey was limited to accessible areas.

5.2 Limited Soil Assessment

It should be noted that, congruent to the limited geophysical survey, the majority of the property was inaccessible due to the buildings which occupied most of the parcel. Boring locations were chosen based primarily on access.

The DENR action levels for both TPH-GRO and TPH-DRO are 10 mg/kg. The QED results did not detect TPH-GRO or TPH-DRO concentrations above 10 mg/kg in any of the soil samples analyzed.

One sample from each boring was sent to the laboratory for analysis of soils using EPA Methods 8260/8270 for volatile and semi-volatile organic compounds based on the site usage history. The laboratory results did not detect any volatile or semi-volatile organic compounds above detection limits.

5.3 Limited Groundwater Assessment

Soil boring 25-3 was converted into a 1-inch diameter temporary monitoring well to a total depth of 14 feet BLS. The depth-to-groundwater was measured at 9.9 feet BLS. The laboratory analysis did not detect concentrations of any compounds above detection limits.

Review of the NCDOT engineering plans indicates that the NCDOT may encounter groundwater at the property during construction activities. However, no evidence of contamination was observed in the water samples collected during this investigation.

5.4 Recommendations

No impacted soils were observed at the property therefore, no calculations or recommendations are required for this parcel. It should be noted that, if impacted soil is encountered during road construction outside the area analyzed by this investigation, the

impacted soil should be managed according to NC DENR Division of Waste Management (DWM) UST Section Guidelines and disposed of at a permitted facility.

6.0 Limitations

The results of this preliminary investigation are limited to the boring locations completed during this limited assessment and presented in this report. The laboratory results only reflect the current conditions at the locations sampled on the date this PSA was performed.

7.0 Closure

This report was prepared for, and is available solely for use by NCDOT and their designees. The contents thereof may not be used or relied upon by any other person without the express written consent and authorization of Pyramid Environmental & Engineering, P.C. (Pyramid). The observations, conclusions, and recommendations documented in this report are based on site conditions and information reviewed at the time of Pyramid's investigation. Pyramid appreciates the opportunity to provide this environmental service.

EXECUTIVE SUMMARY

Project Description: Pyramid Environmental conducted a geophysical investigation for the North Carolina Department of Transportation (NCDOT), at the Tally Investments, LLC property, Parcel 025, 460 W. Rowan St., Fayetteville, Cumberland County, NC. The survey was part of an NCDOT Right-of-Way (ROW) investigation (NCDOT Project B-4490). The geophysical survey boundaries at the project site were designed to include the portions of the property between the existing edge of pavement and the proposed ROW and easements, whichever distance was greater. The geophysical investigation consisted of a ground penetrating radar (GPR) survey.

Geophysical Results: All accessible areas of the parcel were surveyed by the GPR, and no large structures were identified. Isolated zones of possible debris and suspected utilities were identified by the GPR. The geophysical investigation did not record evidence of any metallic USTs at the property. However, it should be noted that only a small portion of the property was surveyed due to the buildings and parked vehicles on-site. Additionally, the extensive metal across the site (buildings, vehicles, and fences) prevented EM61 data from being collected. The most effective approach to locating metallic USTs is to first perform a metal detection survey using EM61, followed by a GPR survey. In this case, the typical approach was not possible.

INTRODUCTION

Pyramid Environmental conducted a geophysical investigation for the North Carolina Department of Transportation (NCDOT), at the Tally Investments, LLC property, Parcel 025, 460 W. Rowan St., Fayetteville, Cumberland County, NC. The survey was part of an NCDOT Right-of-Way (ROW) investigation (NCDOT Project B-4490). The NCDOT indicated that the site was anticipated to be a total take, and the geophysical survey boundaries were designed to include all accessible portions of the parcel. The parcel was approximately 90 feet wide (east to west) and 130 feet from north to south. Conducted on February 4, 2014, the geophysical investigation was performed to determine if unknown, metallic underground storage tanks (USTs) were present beneath the survey area.

The site was an active automobile repair facility consisting of a large warehouse building and an apparent converted residential building directly adjacent to the warehouse. The two buildings encompassed the vast majority of the property, resulting in extremely limited access. A significant number of parked vehicles were also present on the south and east sides of the buildings. Aerial photographs showing the survey area boundaries and ground-level photographs are shown in **Figure 1**.

FIELD METHODOLOGY

Prior to conducting the geophysical investigation, a 20-foot by 10-foot survey grid was established across the geophysical survey areas using measuring tapes and water-based marking paint. These grid marks were used as X-Y coordinates for location control when collecting the geophysical data and establishing base maps for the geophysical results.

The geophysical investigation consisted of a ground penetrating radar (GPR) survey. EM61 data were not collected at this site due to the extremely limited access combined with the extensive number of parked vehicles and chain link fence surrounding the property.

GPR data were acquired across all accessible portions of the parcel on February 4, 2014, using a Geophysical Survey Systems, Inc. (GSSI) SIR-2000 unit equipped with a 400 MHz antenna.

Data were collected generally from east to west and north to south across the property. The GPR data were viewed in real time using a vertical scan of 512 samples, at a rate of 48 scans per second. GPR data were viewed down to a maximum depth of approximately 8 feet, based on an estimated two-way travel time of 8 nanoseconds per foot. GPR transects were saved to the hard drive of the SIR unit for post-processing and figure generation.

DISCUSSION OF RESULTS

Discussion of GPR Survey: **Figure 2** presents the locations of the formal GPR transects performed at the property, as well as images of some of the transects. **Appendix A** includes images of all GPR transects performed at the site. GPR Transects 1-11 were performed across the accessible portions of the property. Isolated areas of possible debris and suspected utilities were identified on the southeast portion of the property. The suspected utilities correlated to utilities that were subsequently marked by the private utility locator. Reinforced concrete was observed at the driveway on the southwest portion of the property leading up to the warehouse building. No large structures were observed in the subsurface at the locations of the GPR transects that would suggest the presence of a UST.

The geophysical investigation did not record any evidence of metallic USTs at the property within the survey area limits. However, it should be noted that only a small portion of the property was surveyed due to the buildings and parked vehicles on-site. Additionally, the extensive metal across the site (buildings, vehicles, and fences) prevented EM61 data from being collected. The most effective approach to locating metallic USTs is to first perform a metal detection survey using EM61, followed by a GPR survey. In this case, the typical approach was not possible.

SUMMARY & CONCLUSIONS

Our evaluation of the GPR data collected across Parcel 025 in Fayetteville, North Carolina, provides the following summary and conclusions:

- The GPR survey provided reliable results for the detection of metallic USTs within the accessible portions of the geophysical survey area, however, EM61 data were not collected due to buildings, parked vehicles, and metal fencing.
- All accessible areas of the parcel were surveyed by the GPR, and no large structures were identified. Isolated zones of possible debris and suspected utilities were identified by the GPR.
- The geophysical investigation did not record evidence of any metallic USTs at the property.
- Only a small portion of the property was surveyed due to the buildings and parked vehicles on-site. Additionally, the extensive metal across the site (buildings, vehicles, and fences) prevented EM61 data from being collected.

LIMITATIONS

Geophysical surveys have been performed and this report prepared for the NCDOT in accordance with generally accepted guidelines for EM61 and GPR surveys. It is generally recognized that the results of the EM61 and GPR surveys are non-unique and may not represent actual subsurface conditions. The EM61 and GPR results obtained for this project have not conclusively determined the definitive presence or absence of metallic USTs, but that the evidence collected is sufficient to result in the conclusions made in this report. Additionally, it should be understood that areas containing extensive vegetation, reinforced concrete, or other restrictions to the accessibility of the geophysical instruments could not be fully investigated.

PYRAMID PROJECT #:	2014-008	FIGURE 1

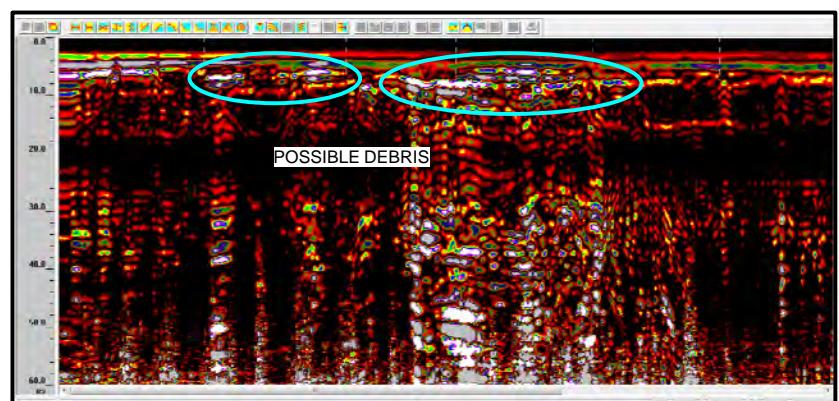

NO EVIDENCE OF USTs OBSERVED

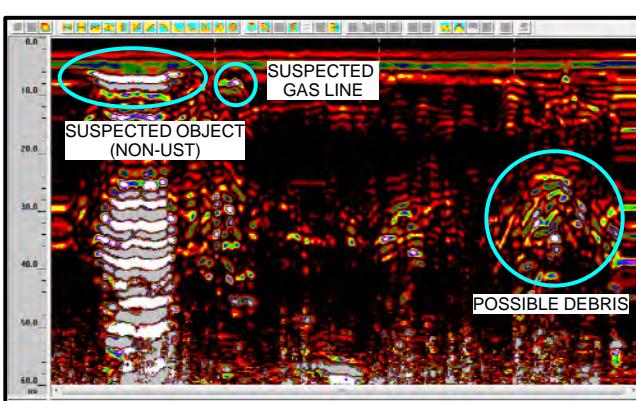

EM61 data were not collected at this parcel due to limited access and extensive cultural interference such as chain link fences, buildings, and multiple parked vehicles. Ground penetrating radar (GPR) data were collected on February 4, 2013, using a GSSI SIR 2000 unit coupled to a 400 MHz antennae. GPR transects were performed in a grid-like fashion across all accessible areas of the property. No evidence of any large subsurface structures was recorded by the GPR that would be indicative of possible or probable USTs. It should be noted that large portions of the property were not surveyed due to inaccessibility resulting from buildings and vehicles.

RE: Project: WBS 33727.1.1 Cumberland 25
Pace Project No.: 92190306

Dear Chemical Engineer:

Enclosed are the analytical results for sample(s) received by the laboratory on February 19, 2014. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

Analyses were performed at the Pace Analytical Services location indicated on the sample analyte page for analysis unless otherwise footnoted.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jon D Bradley

QUALIFIERS

Project: WBS 33727.1.1 Cumberland 25

Pace Project No.: 92190306

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Acid preservation may not be appropriate for 2-Chloroethylvinyl ether, Styrene, and Vinyl chloride.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L3 Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- R1 RPD value was outside control limits.
- S0 Surrogate recovery outside laboratory control limits.
