DETAIL OF ℞s pa & pb

One Assembly Required for each Girder.

GENERAL NOTES

1. Alloy for Extrusions, Plates and Straps to be 6061-T 6.
2. Filler material to be Alloy 5356.
3. The expansion joints shall be shop assembled as detailed with a normal 3" gap between extrusions B. The assembly shall be adequately braced and blocked to maintain correct alignment and spacing during shipment.
4. All aluminum surfaces in contact with concrete shall be protected with two coats of zinc cromate paint (one wash coat and one prime coat) and a finish coat of alkali-resistant bituminous paint.
5. The expansion joint shall be field set to the correct grade of roadway and parallel with the roadway grade.
6. Lubricate and seal the Aluminum Expansion Joint in the shop before shipment with alkali-resistant grease (Standard Oil Company, Calumet #10X or equal).
7. All contact surfaces for shop or field welding shall be milled to fit.
8. The Expansion Joint shall be fabricated to fit the roadway Cross Section.
9. Welding to be in accordance with the latest revised AWS Specifications.

GENERAL NOTES

1. Assumed Live Load H.S. 15-44
2. For other Design Data and General Note see sheet S-N.
3. The contractor shall be required to maintain water traffic in a manner satisfactory to both the Engineer and the U.S. Coast Guard and in accordance with the Special Provisions.
4. For protection of material from salt water see Special Provisions.
5. Construction Elevations for setting the forms and screeds will be furnished to the Resident Engineer by the Bridge Design Dept. upon request before construction of deck is begun.
6. See Special Provisions for method of curing bridge deck and mixing and applying the linseed oil solution.
7. Piles for End Bent #2 to be driven through the roadway fill.
8. The contractor will be responsible for determining lengths of piles required for Bent 32-S and End Bent No. 2. See Special Provisions.
9. All 1½"ø x 18" anchor bolts and hex nuts are to be hot dipped galvanized after fabrication. Galvanizing shall be at a uniform rate of 2 oz. per sq. ft. of surface in accordance with A.S.T.M. specifications A-123. Anchor bolts, hex nuts, and galvanizing will not be paid for as a separate item; the entire cost of same to be included in the unit prices bid for the several pay items.
10. For sheet showing location of supports for utility lines see Sheet 9-39

BUILT ACCORDING TO PLANS

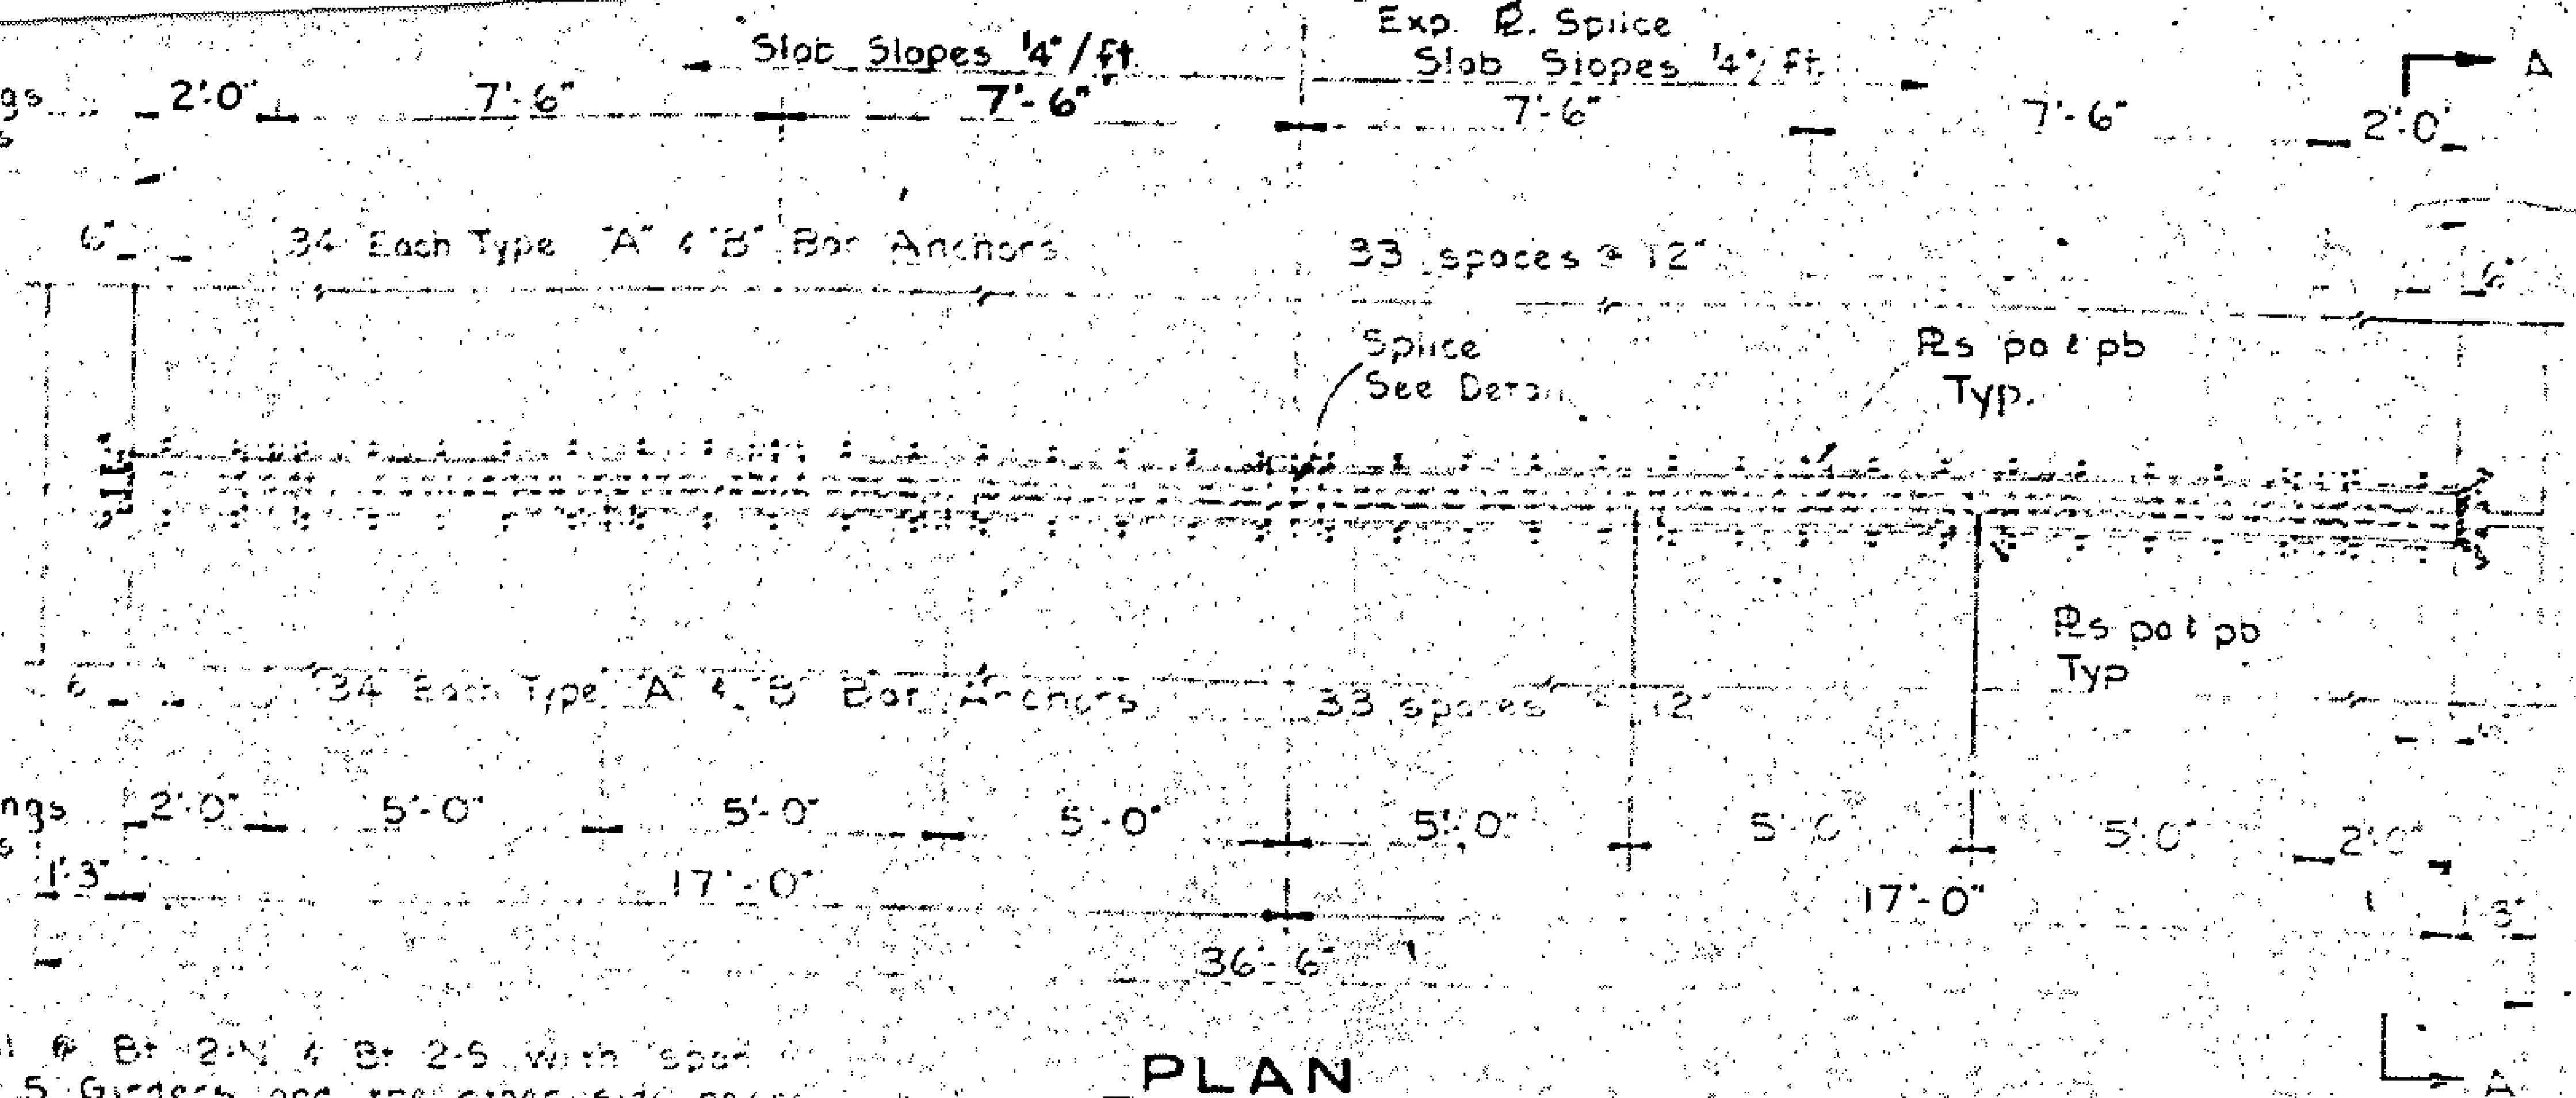
NOTE
Spans 1, 2-N & 2-S have 7 Girders each. All other spans have 5 Girders each.

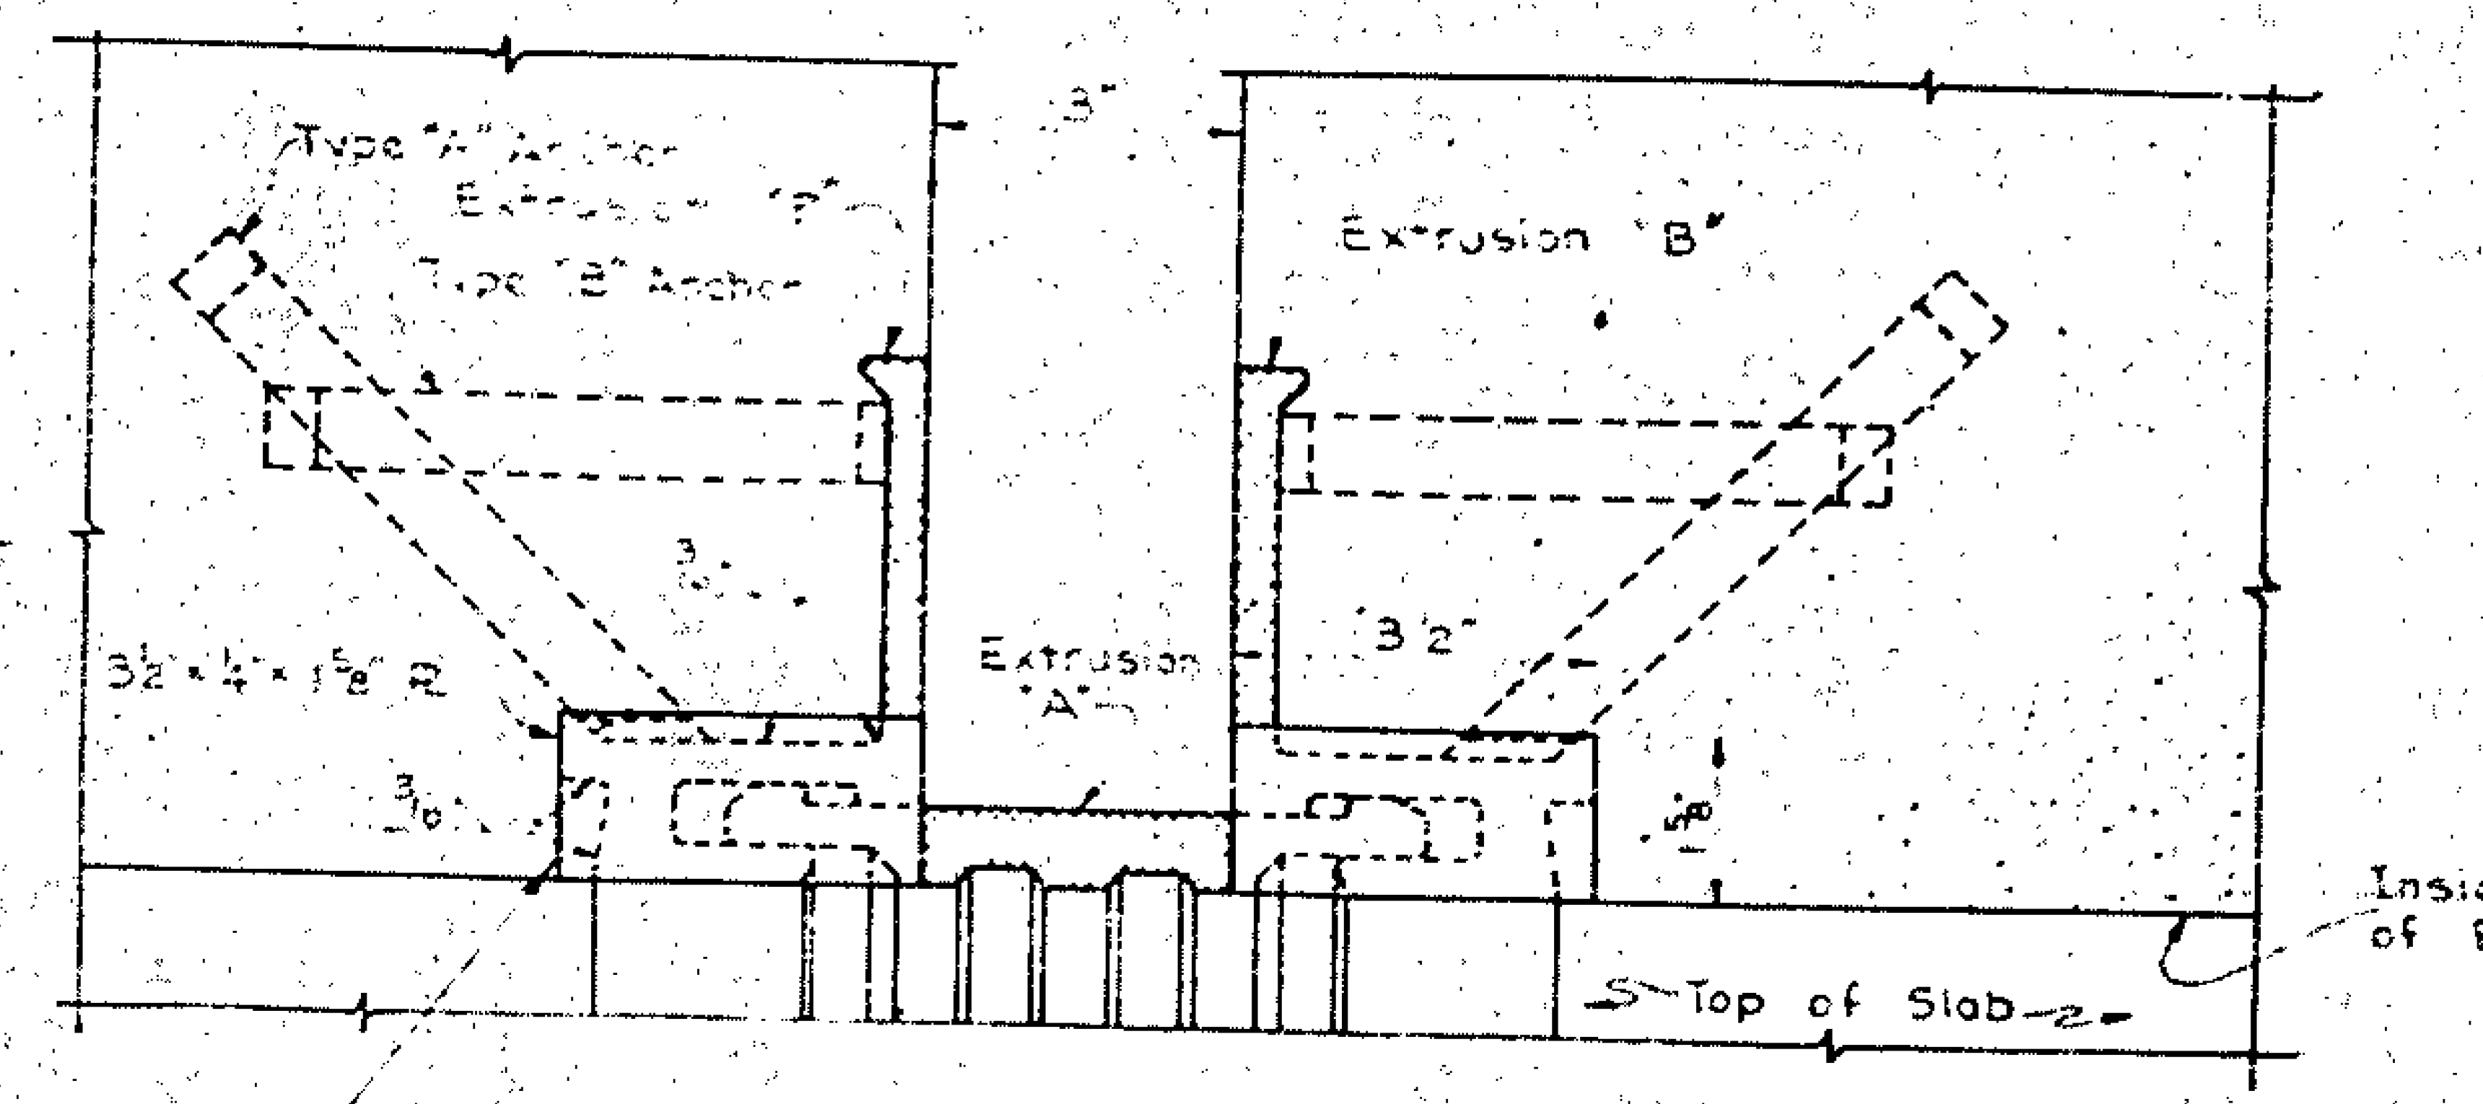


PLAN
(See Note at Left)

NOTE: PLAN typical @ Bt 2-N & Bt 2-S with span on one side having 5 Girders and the other side having 7 Girders (2 required). All other Expansion Plates are located between spans having 5 Girders each (18 required). Total Aluminum Expansion Plates required 20.

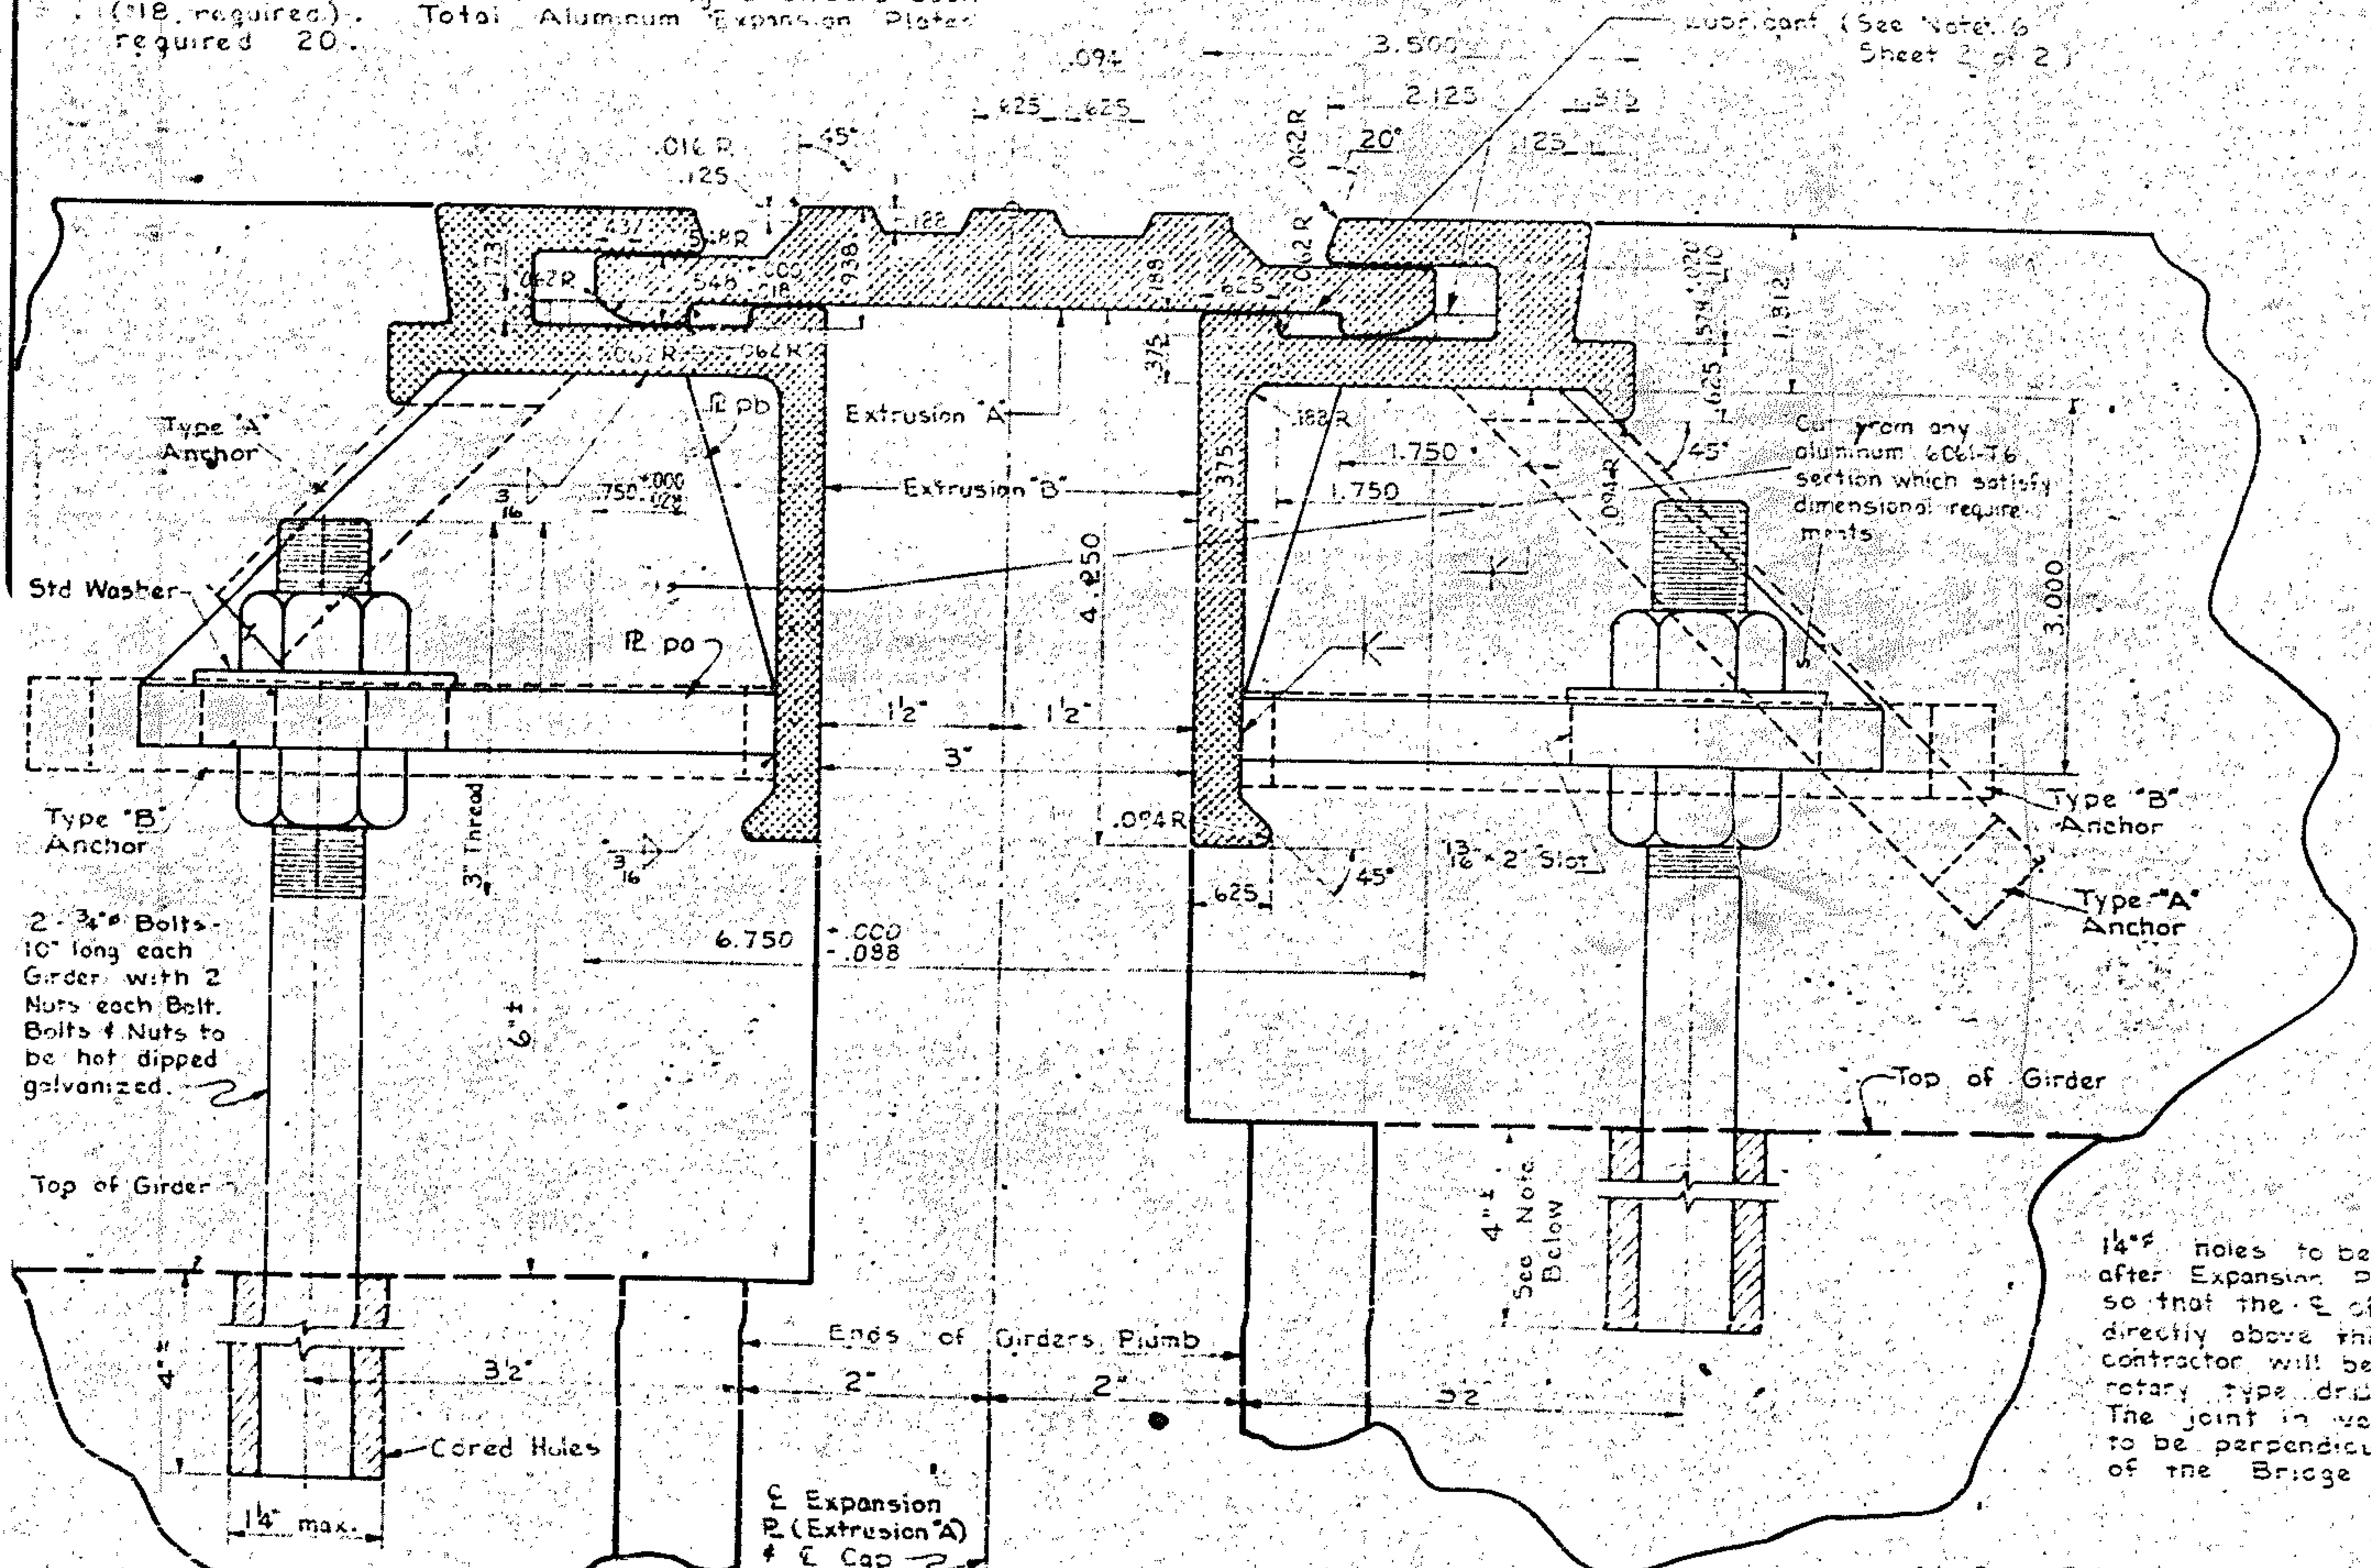
Slab and Parapet steel shall be bent as shown so there will be no contact with Aluminum Expansion Joint.

Tie bars in Rail Post may be shifted to clear Aluminum Expansion Joint or Anchors in Parapet.



SECTION C-C

Aluminum Closure Plate 3 1/2" x 4" x 1 5/8" welded to end of Extrusion "B" in vertical Parapet Section as shown.



1 1/4"φ max. cored hole (2 each Girder) in top of Girder field located by contractor after Girders are in-place. Grout with Epoxy.

1 1/4"φ holes to be located by contractor after Expansion Plates have been set so that the ℄ of Expansion Plate is directly above the ℄ of Cap. The contractor will be required to use a rotary type drill to core the holes. The joint in vertical face of Parapet to be perpendicular to the grade of the Bridge slab.

At Span 2-N side of Bent 2-N, and at Span 2-S side of Bent 2-S core holes in ends of Girders 5" deep due to only 3/16" build-up.

GENERAL NOTES

Cost of Guardrail Anchor Bolt unit, consisting of 3 - 1/4"⌀ High Strength bolts, nuts, washers, 5/8"⌀ Studs and 4 1/2"x1/2"x1'-0" plate complete in place, shall be included in the unit contract price bid for Class "AA" Concrete.

The 1/4"⌀ High Strength bolts, nuts, and washers are to conform to the requirements of A.S.T.M. A-325 and are to be galvanized to conform to the requirements of A.S.T.M. A-153.

The 5/8"⌀ Studs are to conform to the requirements of A.S.T.M. A-108. See Special Provisions.

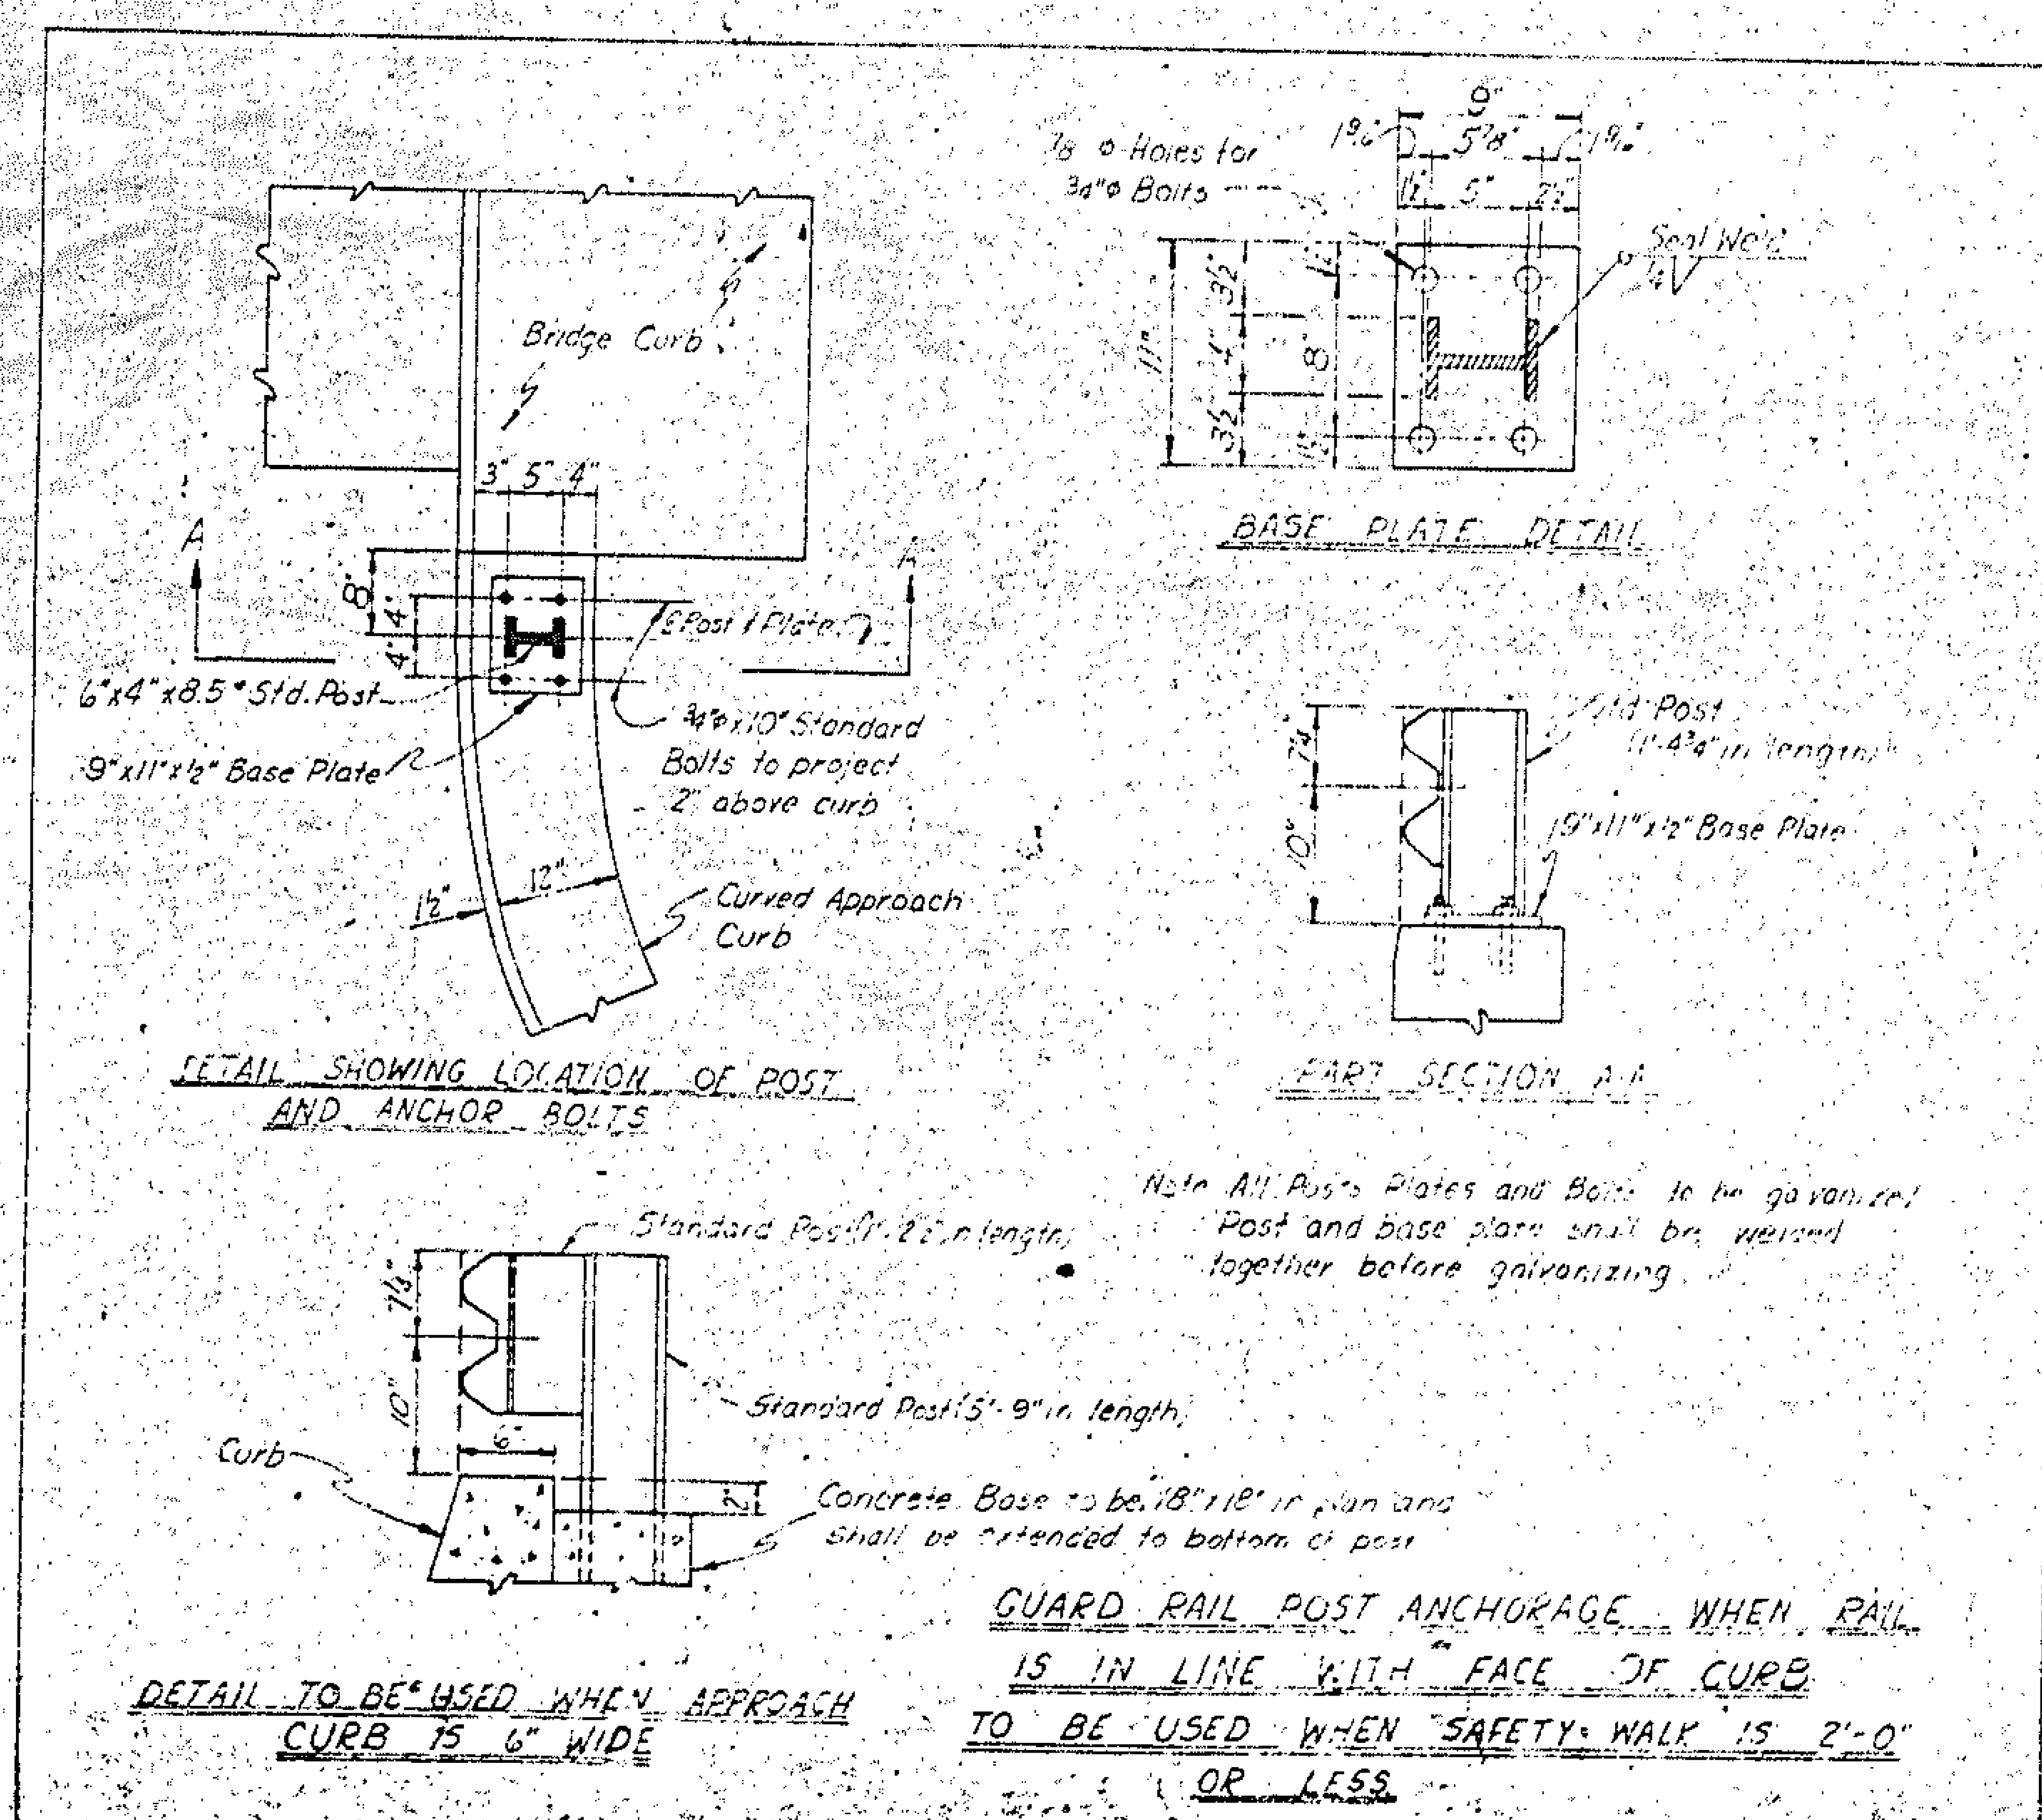
The 4 1/2"x1/2"x1'-0" Plate is to conform to the requirements of A.S.T.M. A-36.

The contractor may substitute, for the stud shown, two 5/8"⌀ studs of shorter length welded one on to the head of the other. The total length of these two studs shall not be less than the 6" required in the Stud Detail.

The standard requirements for High Strength bolts will be followed with the exception of the procedure for nut tightening. Nuts for the 1/4" bolts will be given one half turn with the wrench from a finger tight position. A torque wrench is not required.

The excavation for curbs will not be measured or paid for as a separate item. The entire cost is to be included in the unit price bid for Class "AA" Concrete.

Guard Rail Anchorage to be placed on all 4 End Post.



* For 6" curb and gutter approaching bridge.

** For no curb and gutter approaching bridge.

NOTES

Assumed Live Load HS 15-44

For other Design Data and General Notes, see Sheet S-N.

For bars indicated and no bar mar shown, see concrete plan for different spans.

Temporary struts shall be place between prestressed girders adjacent to the diaphragms, and the nuts on the 1¼"ϕ tie rods shall be tightened befo the diaphragms are cast. Struts shall remain in plac 3 days after concrete is placed. The tie rods shall retightened after the struts have been removed.

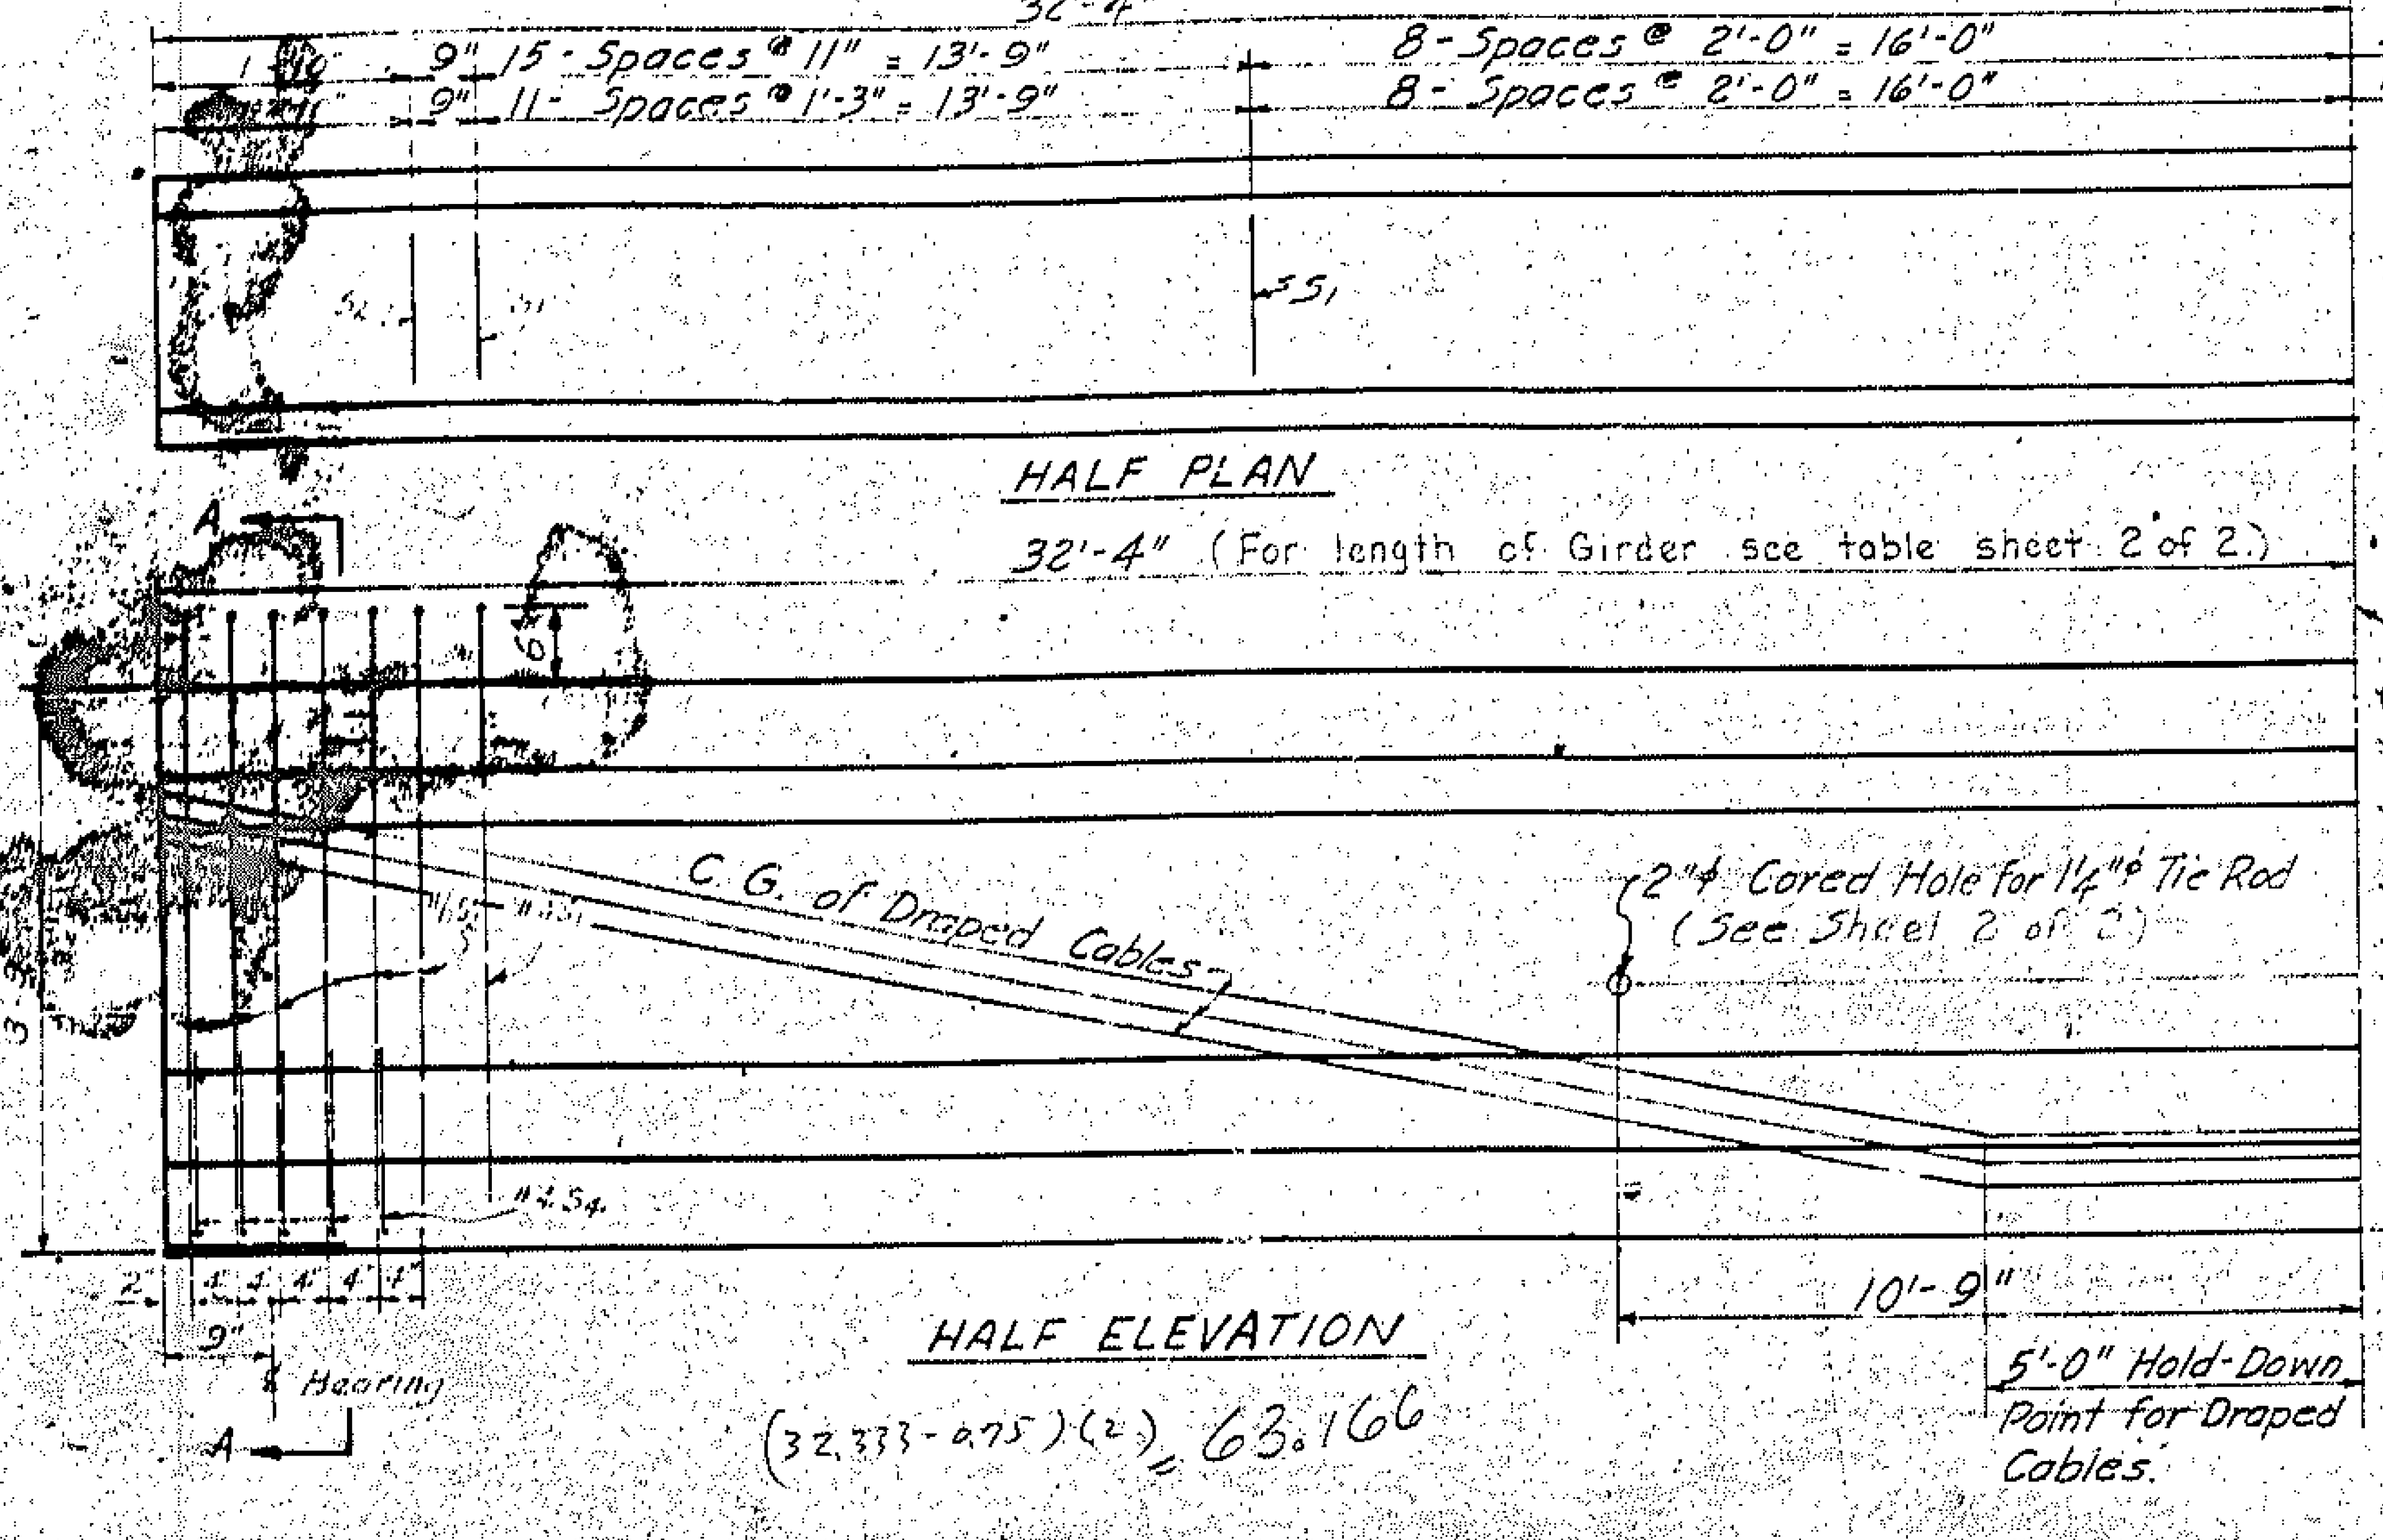
NOTES

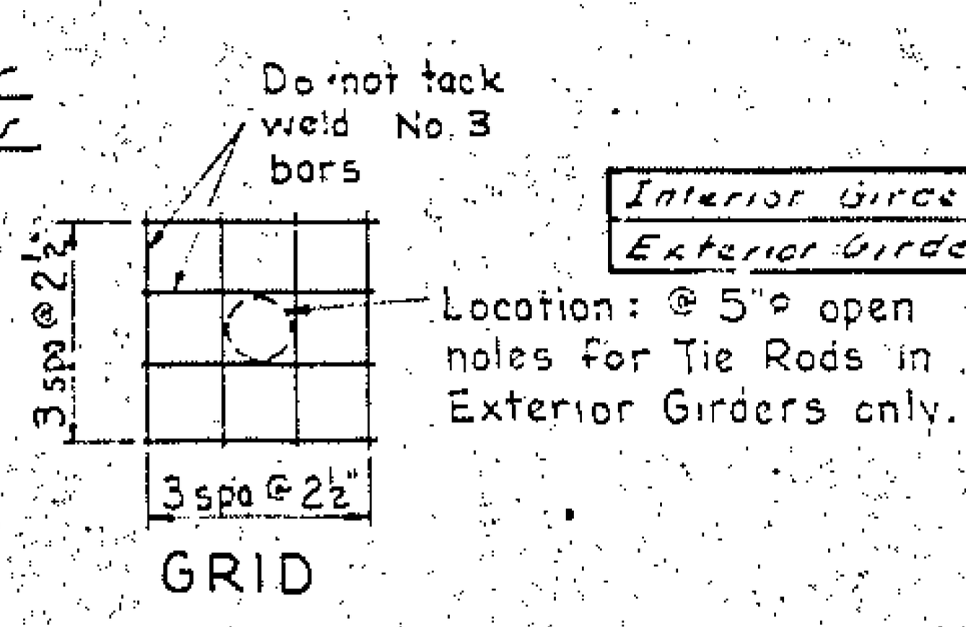
All prestressing strand shall meet the requirements of A.S.T.M.-A416.

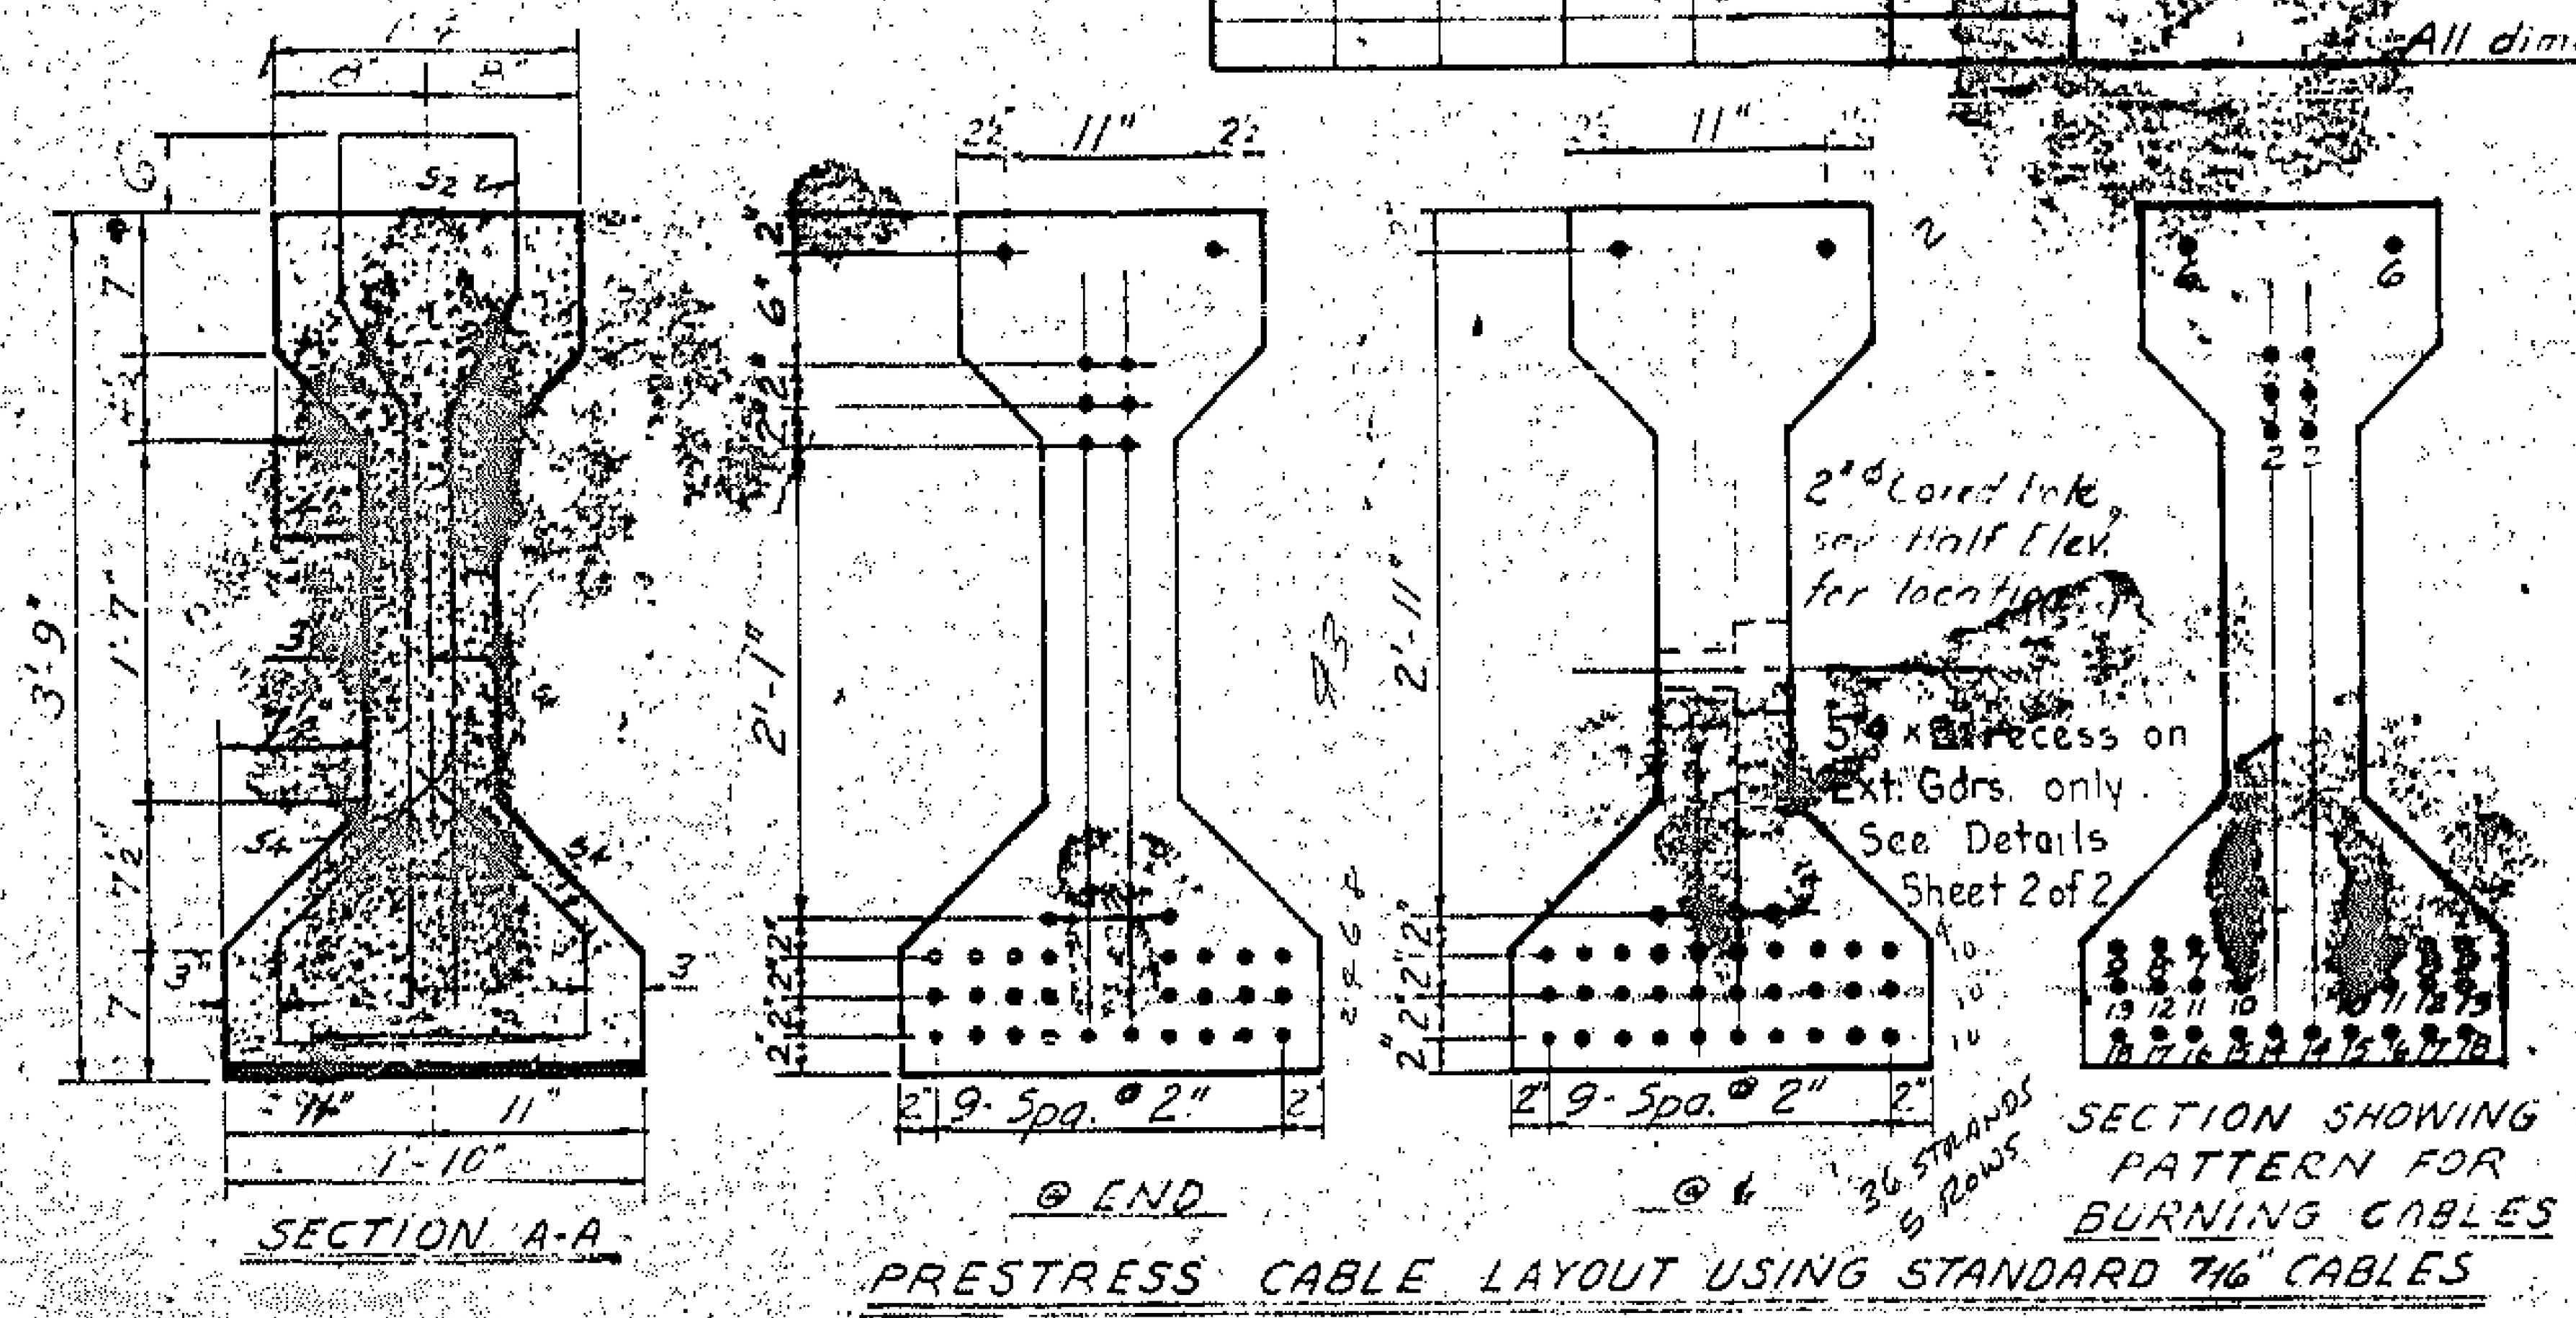
No surface finish will be required for prestressed concrete girders. However the outside face of exterior girders shall be carefully cleaned of drippings and other discolorations. See Specifications.

All prestressing strands shall be 7/16" 7 wire stress relieved cables in accordance with the specifications. At the contractor's option he may use either of the two types of cables listed below; however, all cables within a girder shall be of the same type.

TYPE	AREA	ULTIMATE STR.	APPLIED PRESTRESS
7/16 Std.	0.1089 ☐"	27,000 Lbs per cable	18,900 Lbs per cable
7/16 High Str.	0.1152 ☐"	31,000 Lbs per cable	21,700 Lbs per cable







1. All cables must be cut off flush with end of girder and painted as noted below.
2. Ends of cables and field welds on prestressed girder bearings shall be painted with zinc rich paint conforming to federal specification MIL-P-26915 (U.S.A.F.) Type I.
3. Embedded Plates are to be hot dipped galvanized after fabrication. Galvanizing shall be at a uniform rate of 2 oz. per sq. ft. of surface in accordance with A.S.T.M. specifications A-123.
4. The cost of bearing assemblies, 1¼"ø tie rod assembly, galvanizing of bearing assemblies and painting of cable ends and field welds on bearing assemblies shall be included in the unit price bid for lin. ft. of Prestressed Concrete Girder.

Note: If cable stress is relieved by burning each pair of cables shall be burned at ends of bed and between all girders before burning any of the next pair of cables. The following order of burning shall be strictly adhered to:

For Standard 7/16" Cables		For High Strength 7/16" Cables	
(1) Bottom Cables	1-1	(1) Bottom Cables	1-1
(2) Draped Cables	2-2	(2) Draped Cables	2-2
(3) Draped Cables	3-3	(3) Draped Cables	3-3
(4) Bottom Cables	4-4	(4) Bottom Cables	4-4
(5) Draped Cables	5-5	(5) Draped Cables	5-5
(6) Top Cables	6-6	(6) Top Cables	6-6
(7) Release Hold-Downs		(7) Release Hold-Downs

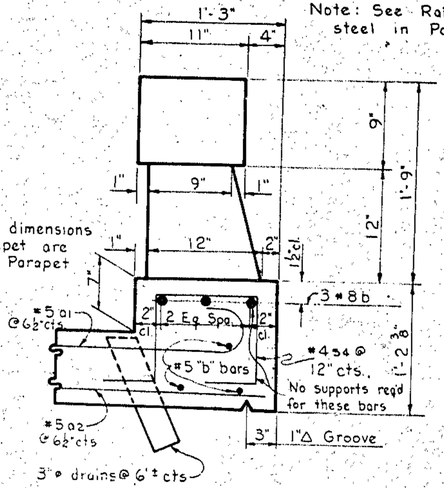
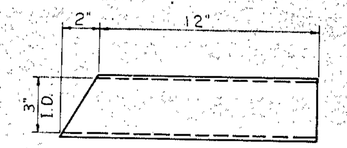
Note: When 'b' bars in top portion of slab are: #4 - use 1½" high UHBB; #6 - use 1¼" high UHBB; or #8 - use 1" high UHBB.



Note: See Rail Sheet for reinforcing steel in Posts and Rails.

Note: All clear dimensions shown in Parapet are from face of Parapet to 'b' bars.

SECTION THRU PARAPET



DRAIN DETAILS
No. Required : 720
Note: Drains shall be of PVC Plastic Pipe. See sheet S-N.
Top of Drains shall be set ⅜" below surface of slab.

NOTES

Assumed Live Load HS 15-44

For other Design Data and General Note, see sheet S-N.

For bars indicated and no bar mark shown, see concrete plan for the different spans.

Temporary struts shall be placed between prestressed girders adjacent to the diaphragms, and the nuts on the 1¼"ø tie rods shall be tightened before the diaphragms are cast. Struts shall remain in place 3 days after concrete is placed. The tie rods shall be retightened after the struts have been removed.

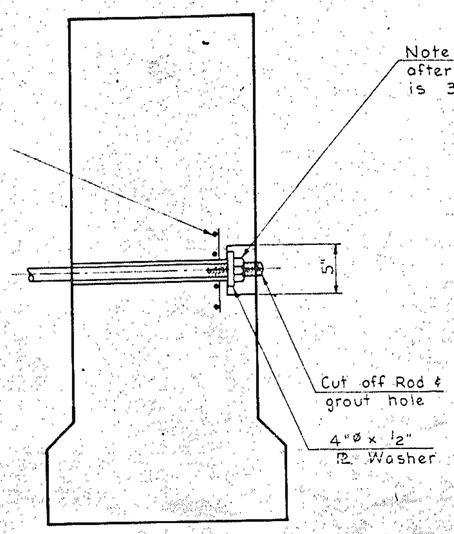
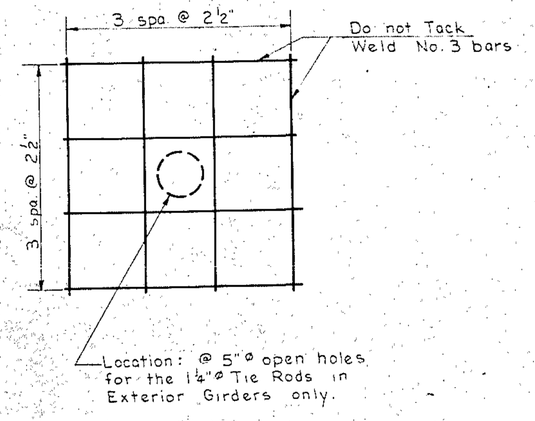
EXTERIOR GIRDER



EXTERIOR GIRDER



NOTES

4. All reinforcing steel shall be included in the contract unit price for prestressed girders.
5. All prestressing strand shall meet the requirements of A.S.T.M.-A-
6. No surface finish will be required for prestressed concrete girder However the outside face of the exterior girders shall be carefully cleaned of drippings and other discolorations, See Specifications.
7. SHOP DRAWINGS: Contractor shall submit Shop Drawings showing complete details of beams including reinforcing steel.
8. FORMS & PALLETS: All girders shall be cast on concrete floored pallets and metal forms.
9. HANDLING: In the handling of girders, they must be maintained in upright position at all times and must be picked up from points located maximum distance of 3'-6" from end of beam. Disregard of this requireme may lead to collapse of the member.
10. Concrete fins or projections shall be removed to produce a vertical face at the top edge of the girder.
11. All prestressed strands shall be ½" 7-wire stress relieved cables and sha have the following properties: ultimate strength 36,000 lbs. per cable; of prestress 25,200 lbs. per cable. The cables shall meet all requirements listed under section 207-A of the standard specification.
12. Shop plans for Prestressed Conc. Girders shall show a complete detensi schedule (burning patern and when to release hold-down points) such to minimize tension in the concrete during release of the strands. De concrete stresses during each operation of detensioning shall be submitte with shop plans.
13. All cables must be cut off flush with end of girder and painted as noted below.
14. Ends of cables and field welds on prestressed girder bearings shall l painted with zinc rich paint conforming to federal specifications MIL-P 2691 (U.S.A.F.) Type I.
15. Embeded plates are to be hot dipped galvanized after fabrication. Galvanizi shall be at a uniform rate of 2 oz. per sq. ft. of surface in accorda with A.S.T.M. Specifications A-123.
16. The cost of bearing assemblies, 1¼"ø tie rod assemblies, galvanizir of bearing assemblies and painting of cable ends and field welds on bearing assemblies shall be included in the unit price bid fo lin. ft. of Prestressed Concrete Girder.

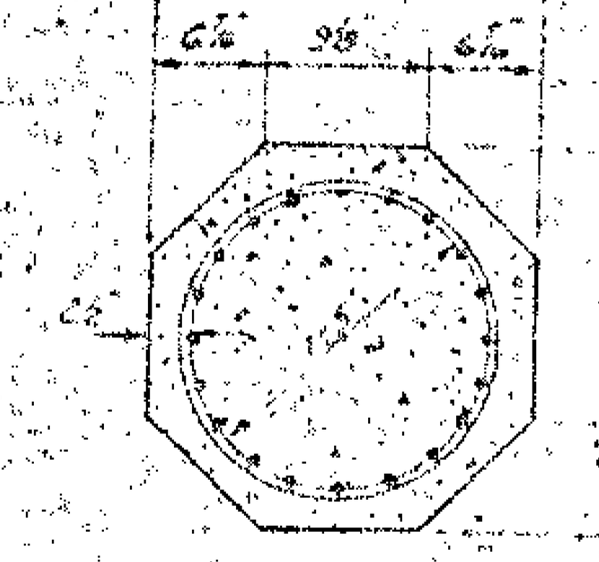
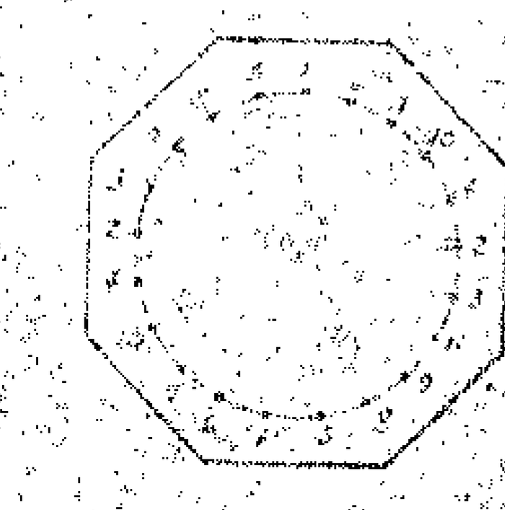
Piles



Typical Section
Showing 20 Prestressing Cables

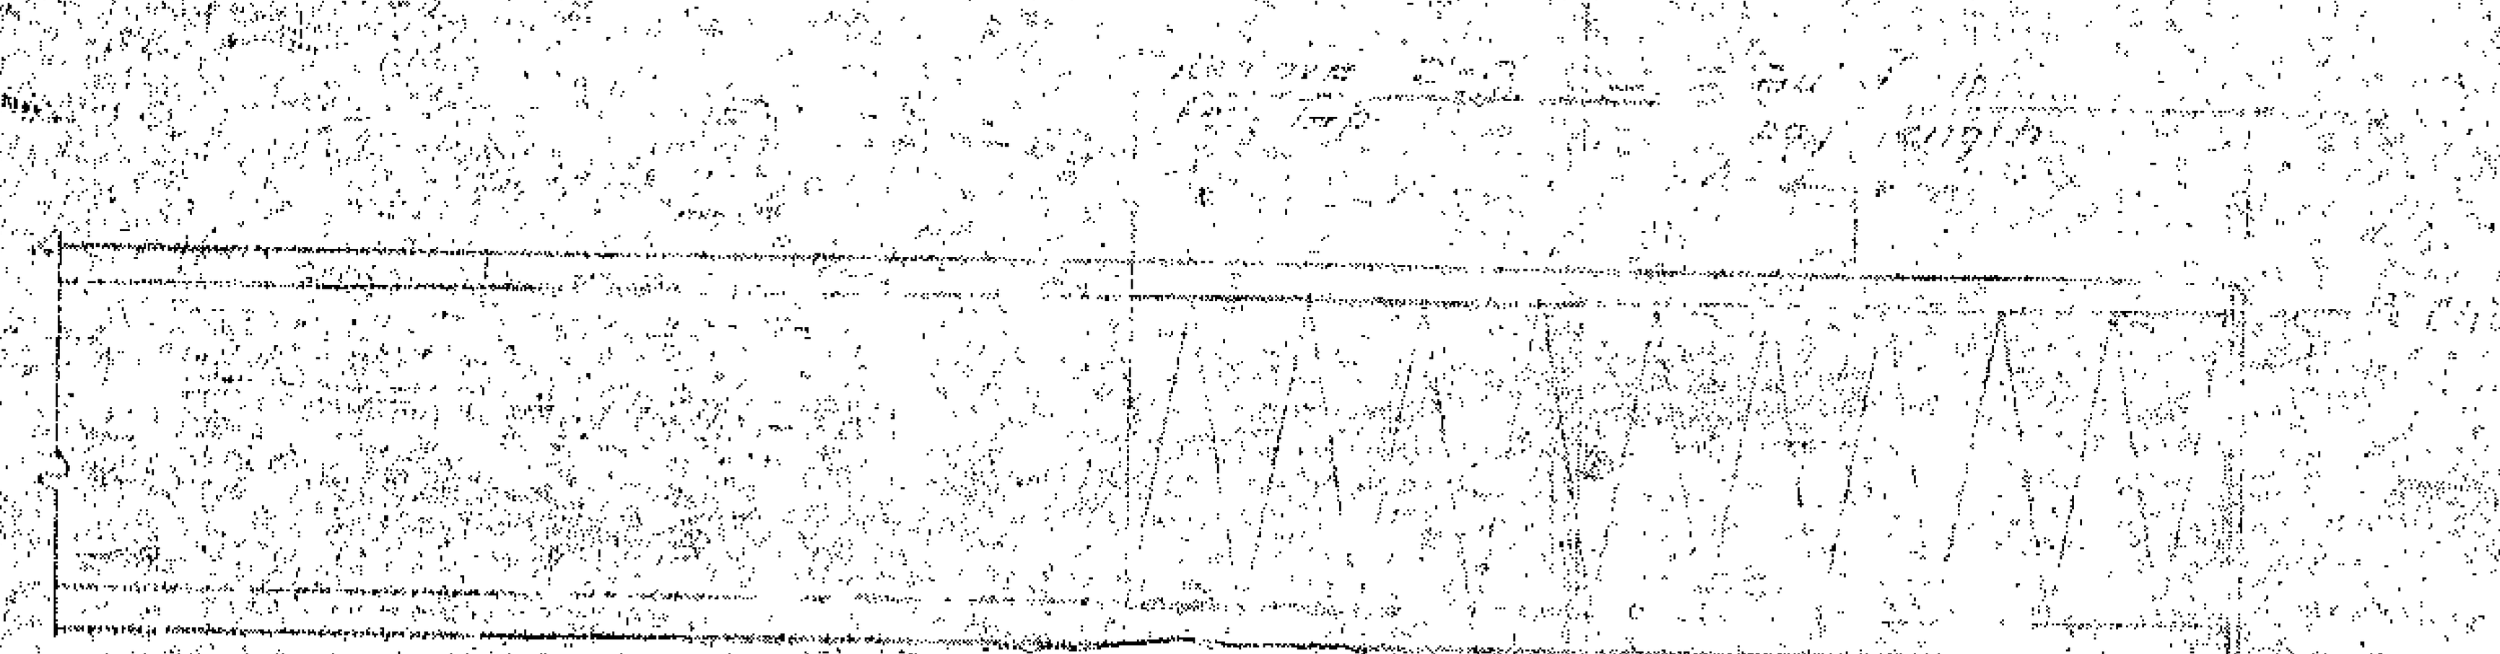
Note: Dampproofing
The length of Pile to be dampproofed may be changed as required by the Engineer. The contractor shall have no claim resulting from any changes in the length of dampproofing required, but he will be paid for the area of dampproofing actually applied at the unit price bid per square yard of Method D Dampproofing. The dampproofing shall be applied before the pile is driven. Because of the coating, support of forms for supporting the Concrete Cap by means of applying Clamps to the piles will not be permitted. Method D Dampproofing shall be applied to the piles over the length shown in Column B in table below. No Dampproofing shall be applied to ... of piles.

Design Data:
Concrete:
f'c = 5000 Lbs per Sq. Inch.
fc = 2000 Lbs per Sq. Inch.

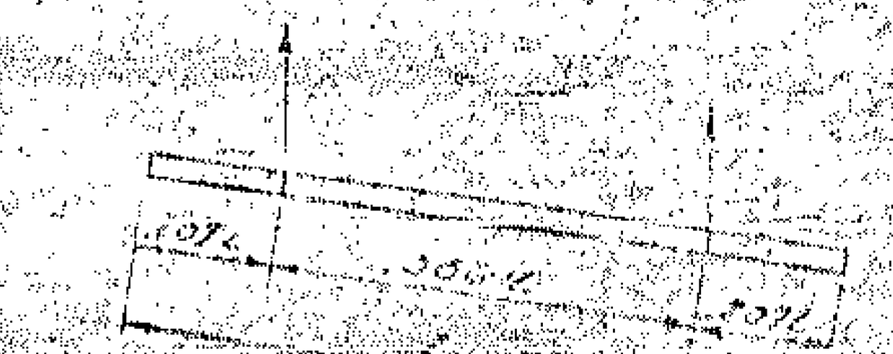


Typical Pattern for Burning Cables.

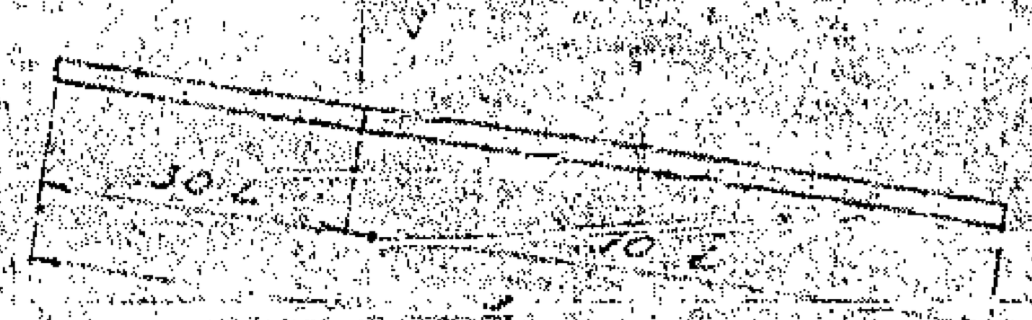
If cable stress is relieved by burning, the cables shall be burned in opposite pairs as ... the typical pattern shown. For any number of cables, burn in opposite pairs and symmetrical about both vertical and horizontal axes. Cables ... shall be burned ... Not more than 4 cables, say 3a and 3b, may be burned at any one section before these same pairs of cables are burned at both ends of the bed and between each pair of piles in the bed.



Pile Building



Method of picking up Piles 62' thru 90'
2 pick up points



Method of picking up Piles ...
1 pick up point

Impact in handling = 30%

General Notes:
In driving piles a method approved by the engineer shall be used ... the head of the pile is not damaged.

Build-up, where necessary, shall be done in accordance with the specifications except that the reinforcing steel required in the build-up shall be included in the contract unit price per foot for the pile and not be paid for as reinforcing steel.

All material and workmanship as per the specifications of the N. Carolina State Highway Commission.

Devices for lifting the piles from the casting beds shall be approved by the Engineer. These devices shall consist of inserts set in the piles to receive threaded eye-bolts, or similar approved devices. The use of loops of cable cast in the piles for use as lifting devices will not be permitted. The use of satisfactory clamps or slings will be permitted where this is practicable without the use of lifting devices cast in the piles. After eye-bolts or other attachments have been removed, the openings shall be repaired in a satisfactory manner before delivery to the bridge site in order to obtain a uniform appearance.

Because of the resulting surface finish, slip-form method of casting piles will not be permitted.

All prestressing strands shall be 7 wire Stress Relieved Cables in accordance with the Specifications. The contractor may at his option use any one of the strand sizes and types shown below, but all cables used in a pile shall be of the same size & type.

Size	Type	No. Cables Req'd.	Area	Ultimate Strength	Applied Prestressing
3/8"	High Str.	23	0.0840"	23,000# per cable	16,100# per cable
7/16"	Standard	20	0.1080"	27,000# per cable	18,900# per cable
7/16"	High Str.	17	0.1152"	31,000# per cable	21,700# per cable

Cables shall be equally spaced around a circle of the diameter shown in the "Typical Section".

All prestressing strand shall meet the requirements of ASTM-A416.

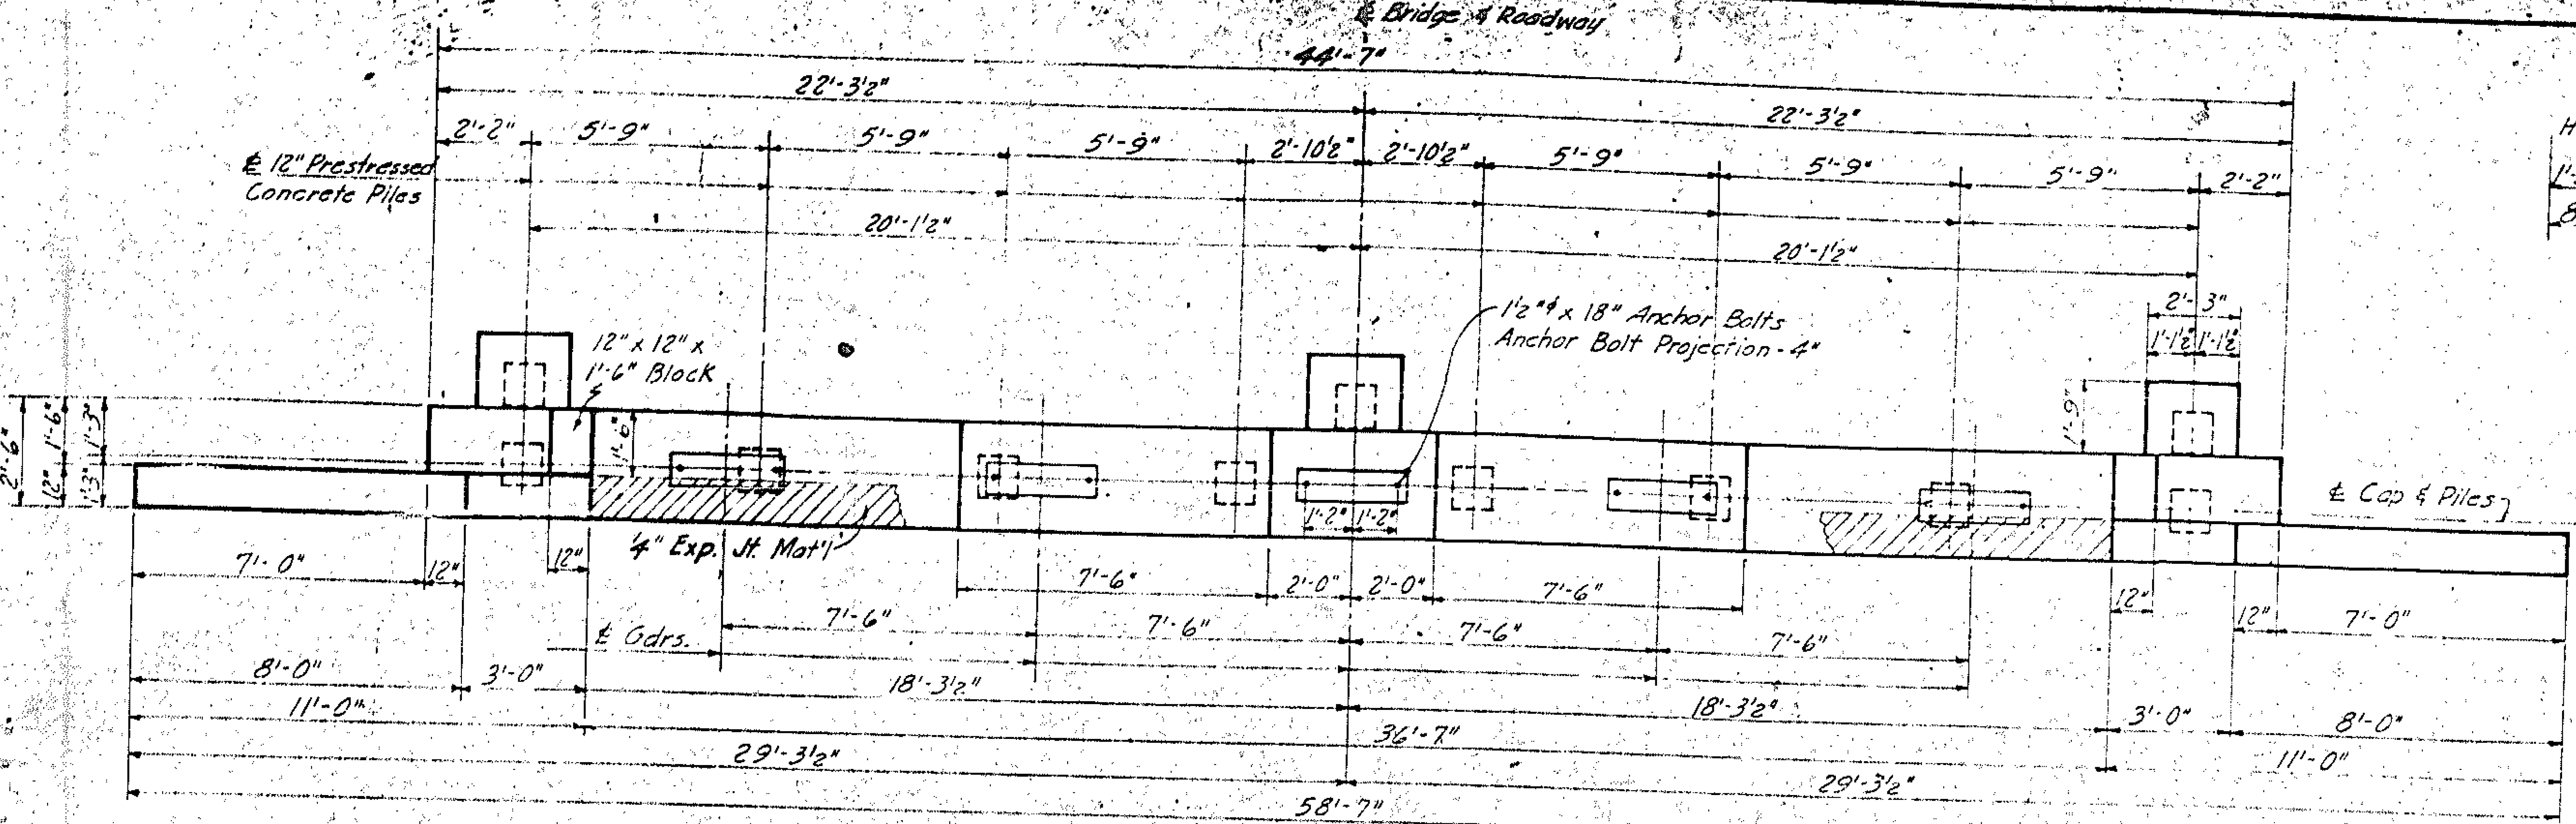
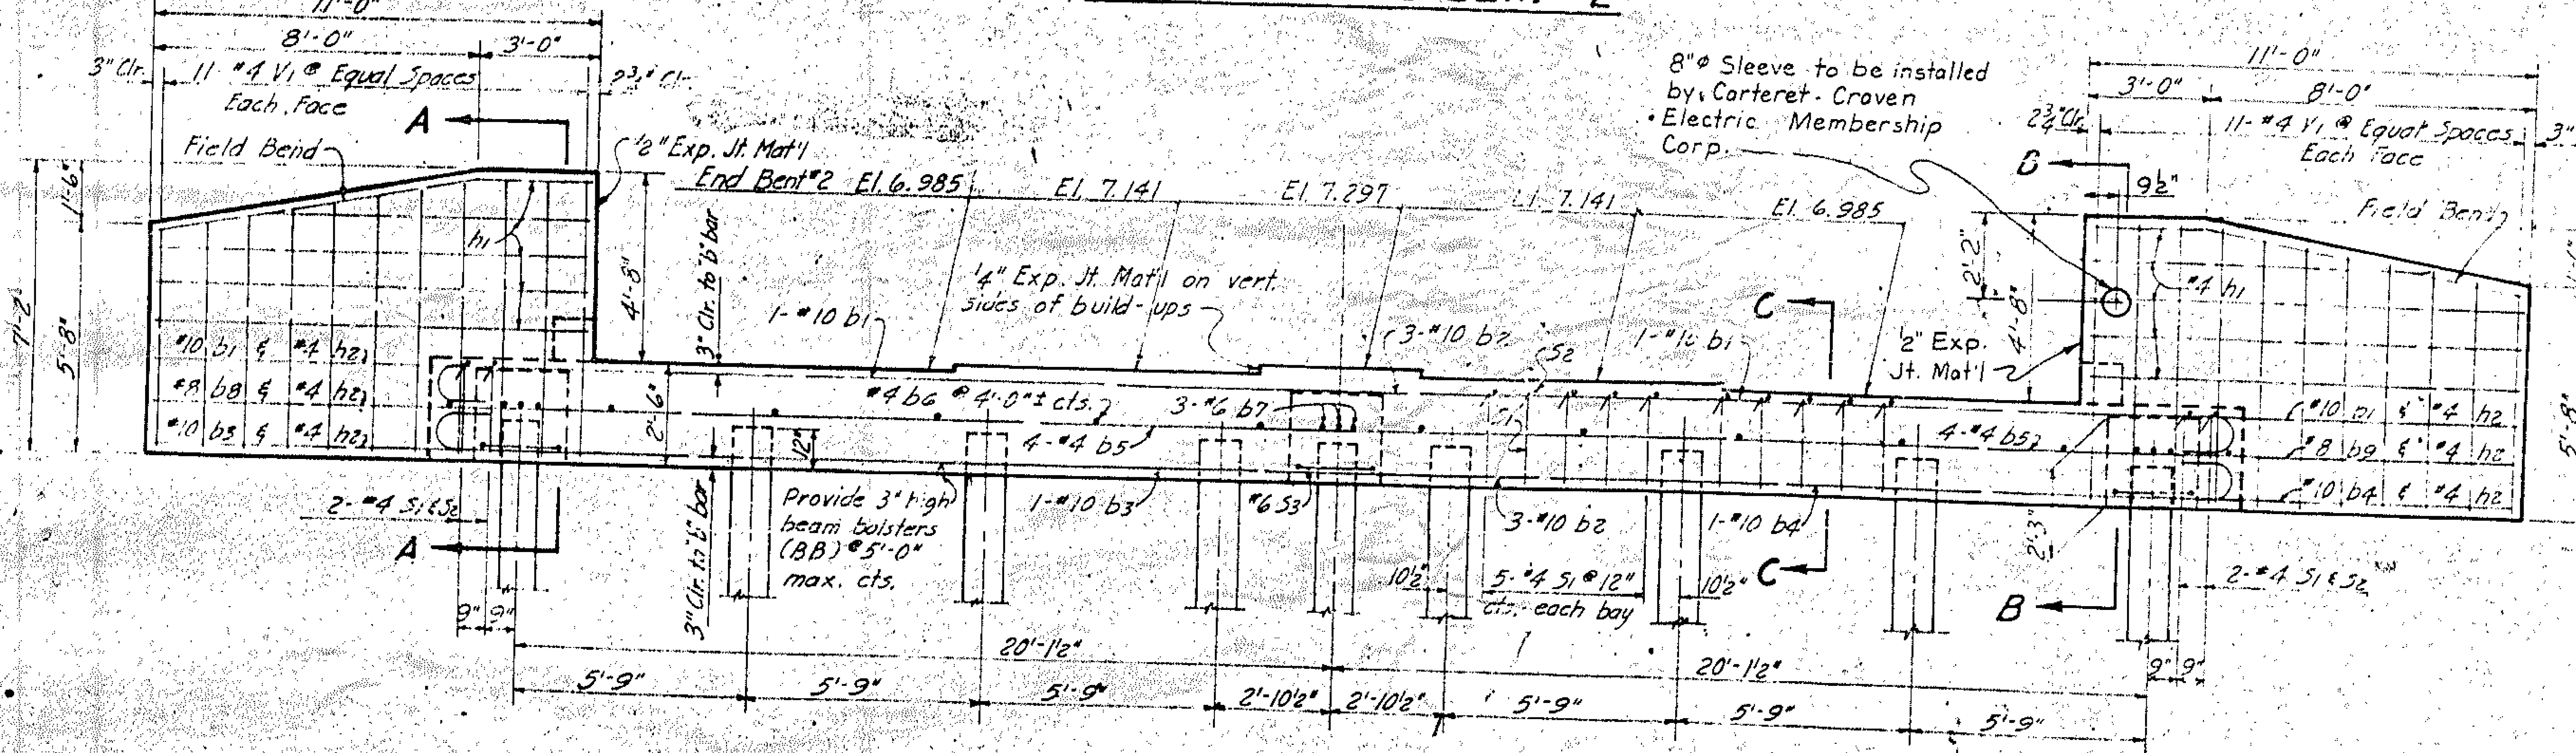
STANDARD	DRAWN BY	DATE July 1959

Rev. Sept. 24, 1963 to show prestressing strand to meet requirements of ASTM-A416 by ... V.B.
Revised to add notes regarding Cables 4-5-62 JLB ...
Revised to clarify buildup detail 3/8/60 M.S.D. ...
Revised to add notes and sketch regarding burning of cables. Jan. 5, 1960 ...

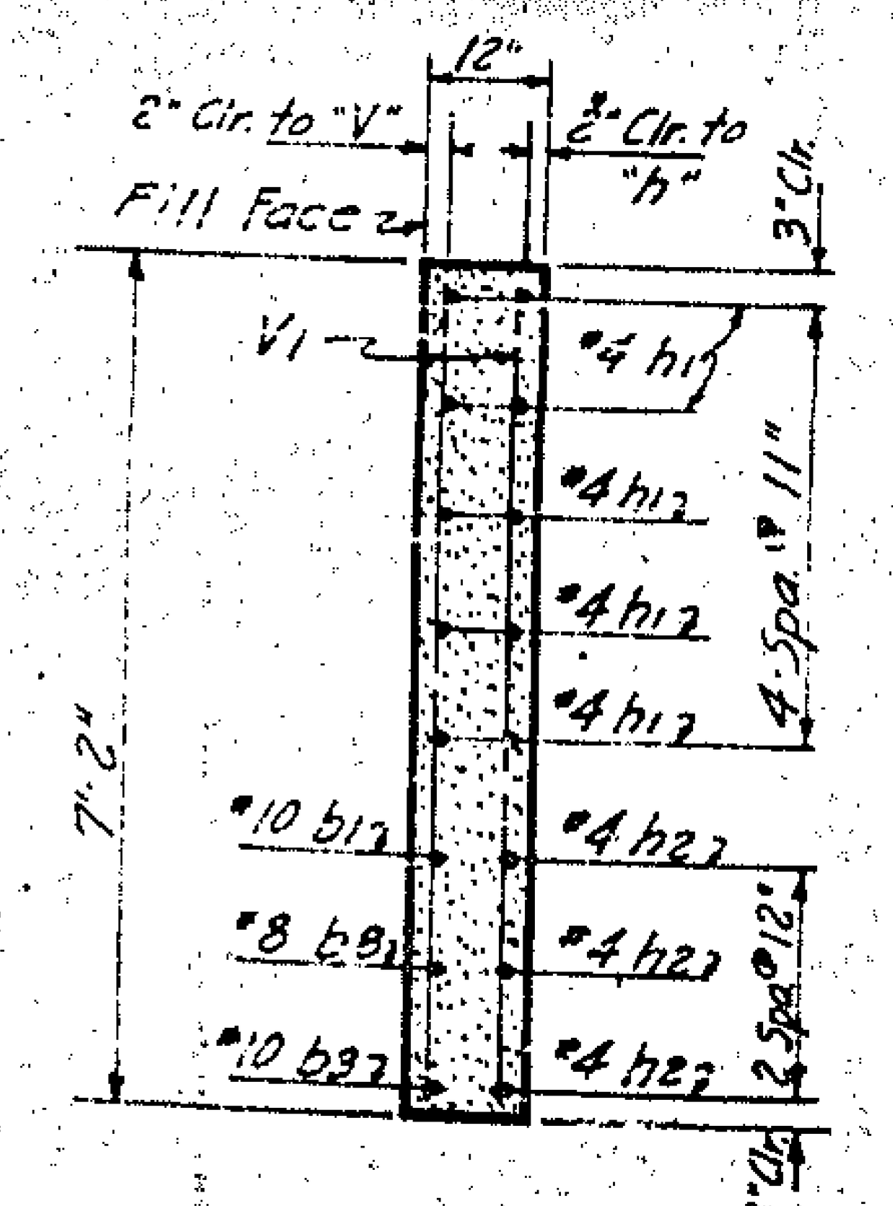
SECTION A-A
SECTION B-B
SECTION C-C



PLAN OF END BENT #2



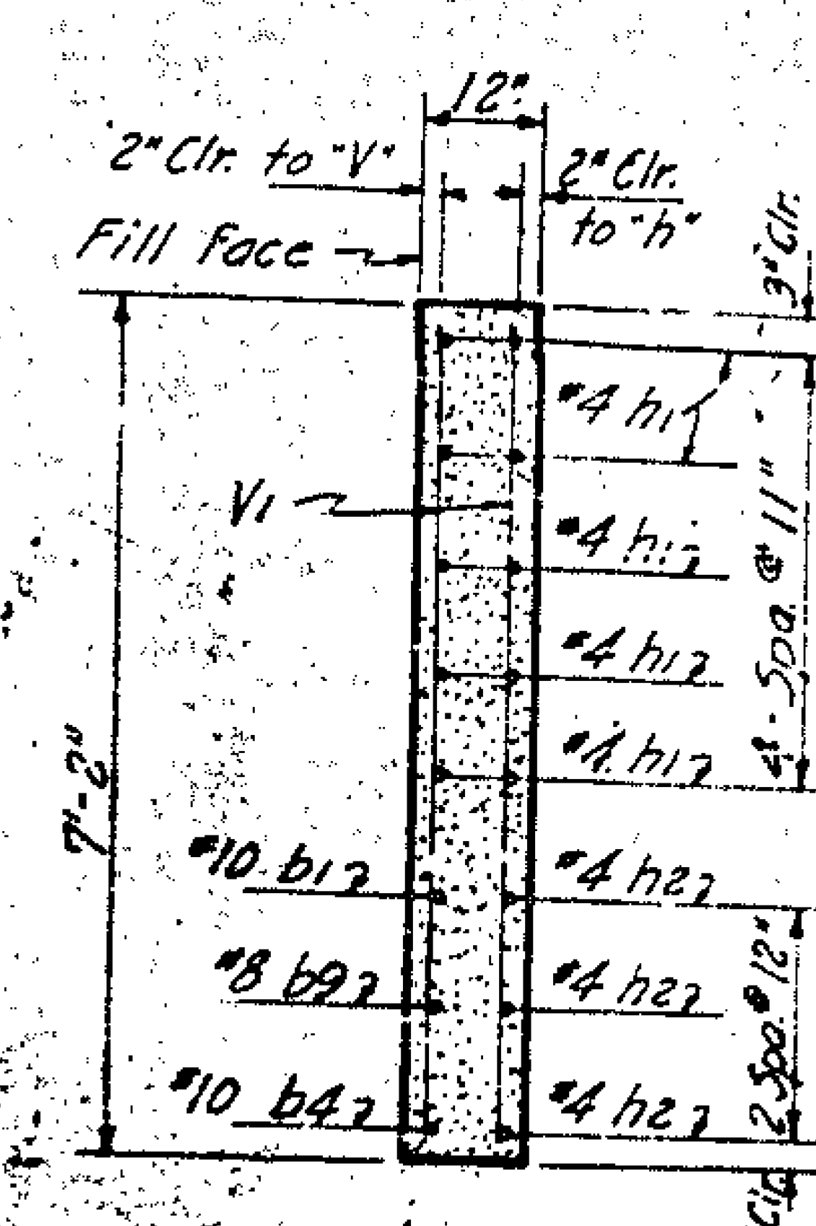
ELEVATION



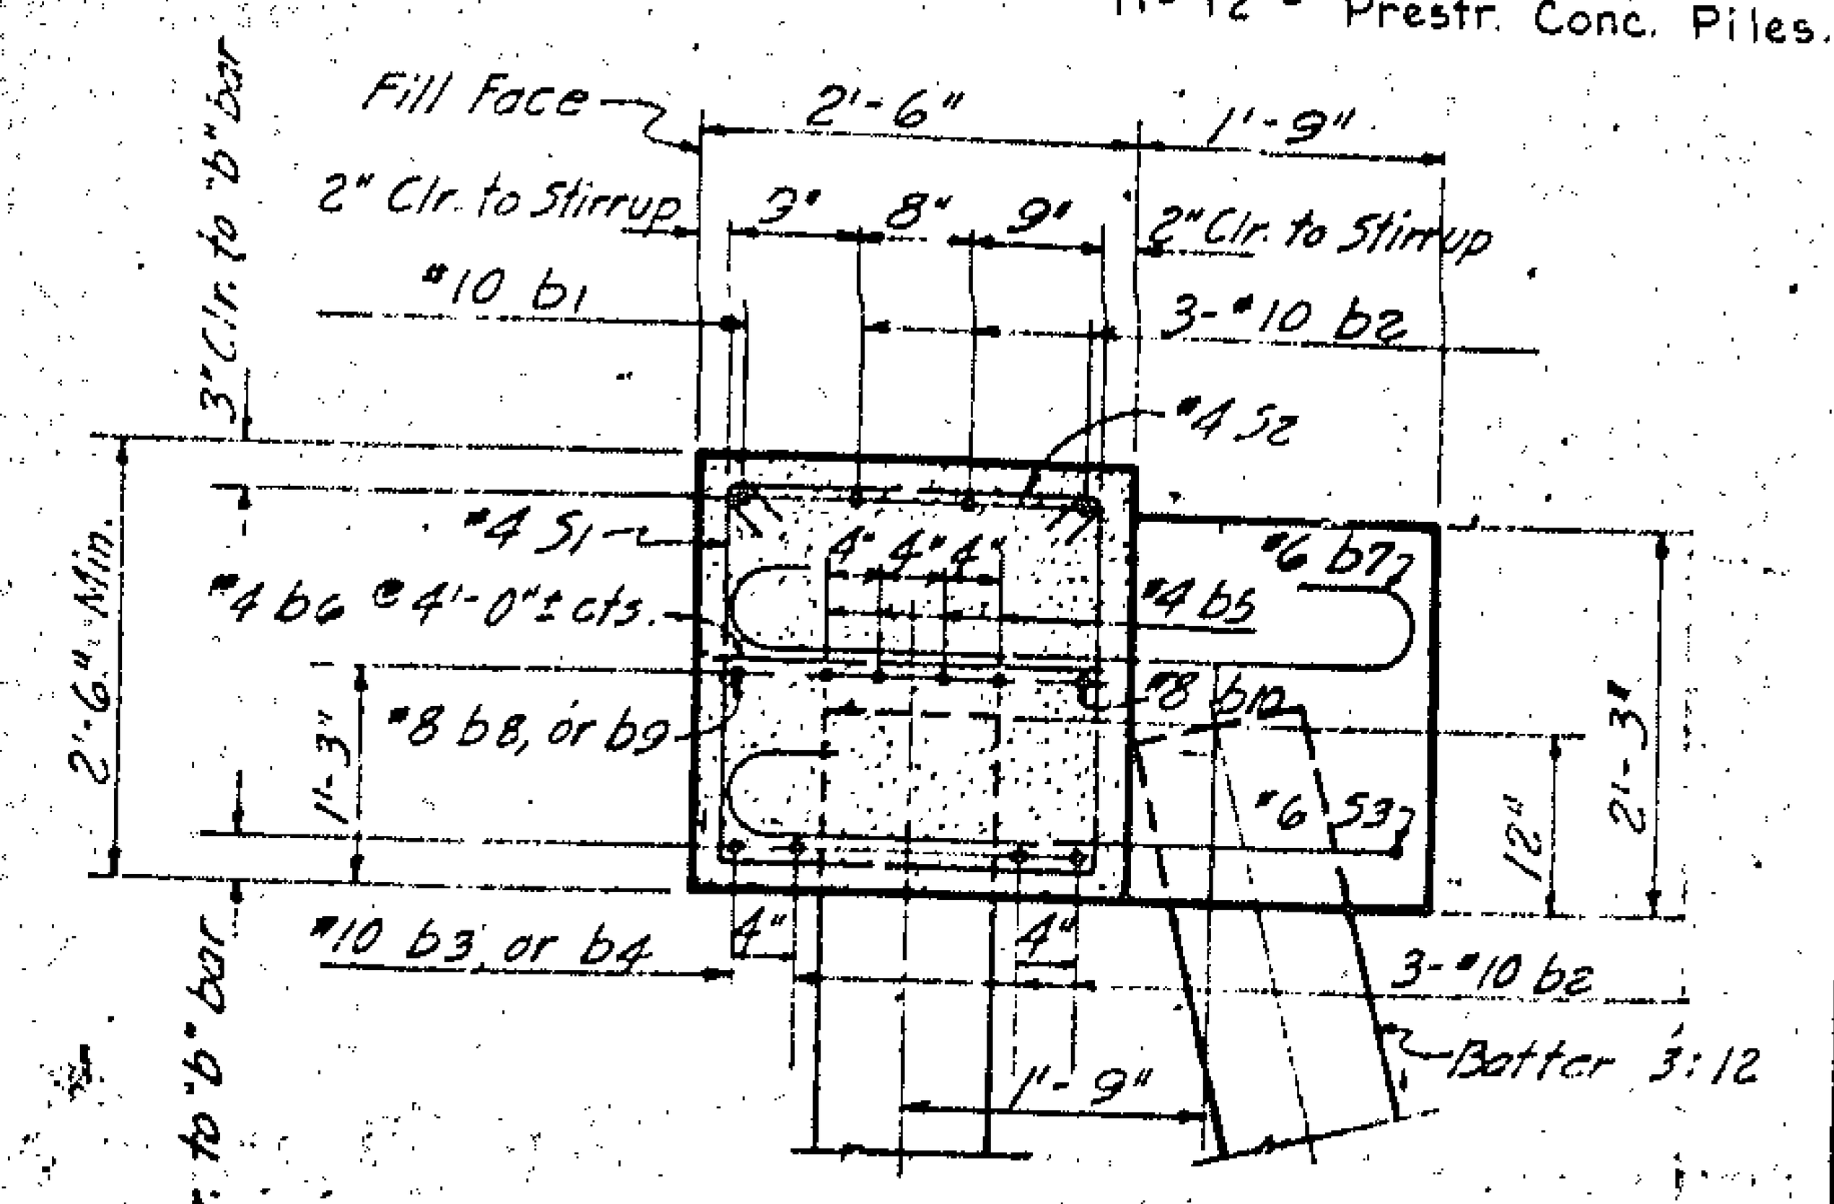
SECTION A-A

Note : The opening drilled through the earwall shall be the minimum required to install the 8"φ sleeve. The excess area around the sleeve shall be packed with an epoxy grout with the surfaces on each face of the earwall neatly finished to the satisfaction of the Engineer.

Revision #1 : 1-20-71 R.G.G. Revised to show 8"φ sleeve to be installed in earwall and Note: ✓ by: [illegible]



SECTION B-B



SECTION C-C

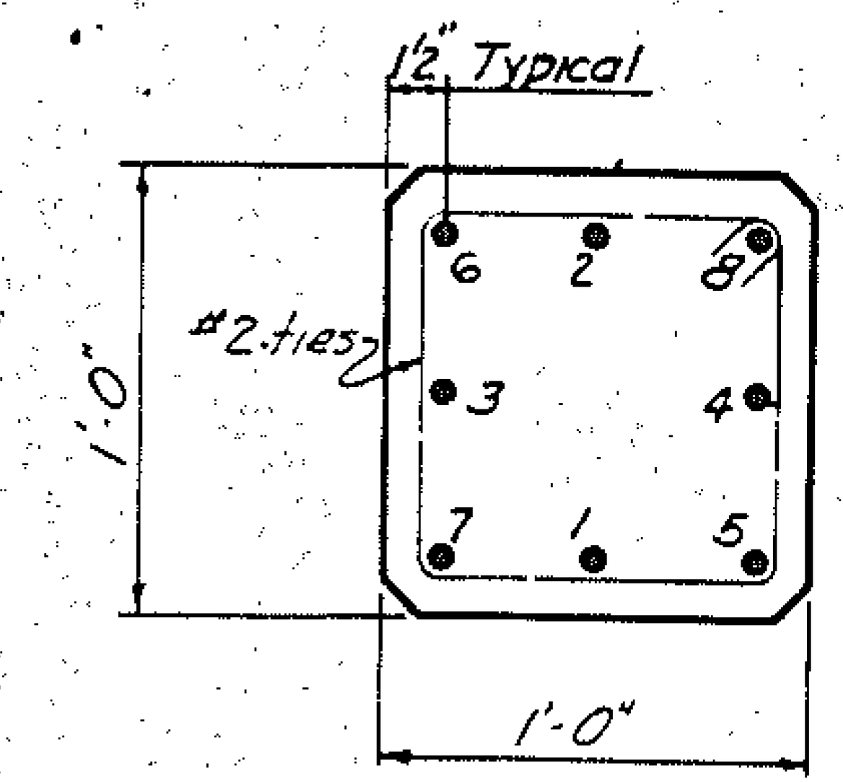
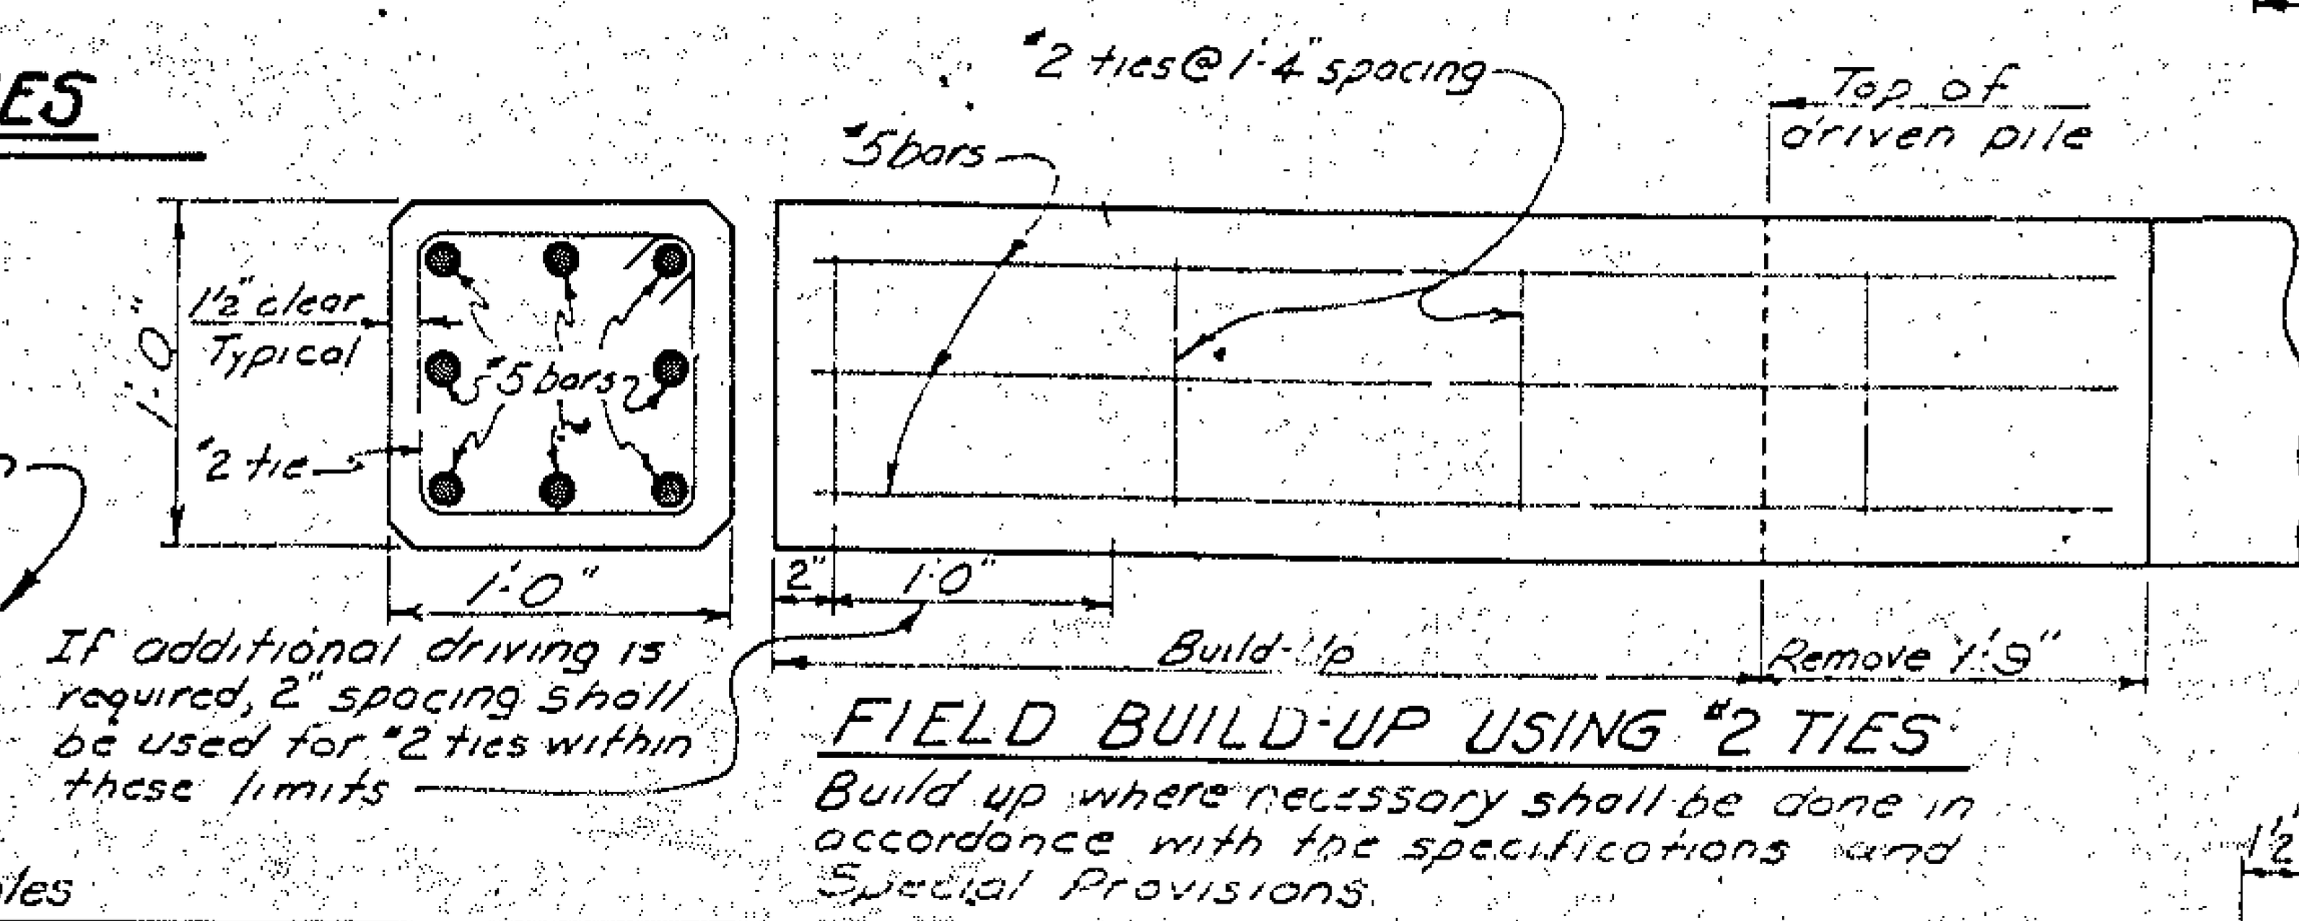
12"□ PRESTRESSED CONCRETE PILES USING #2 TIES

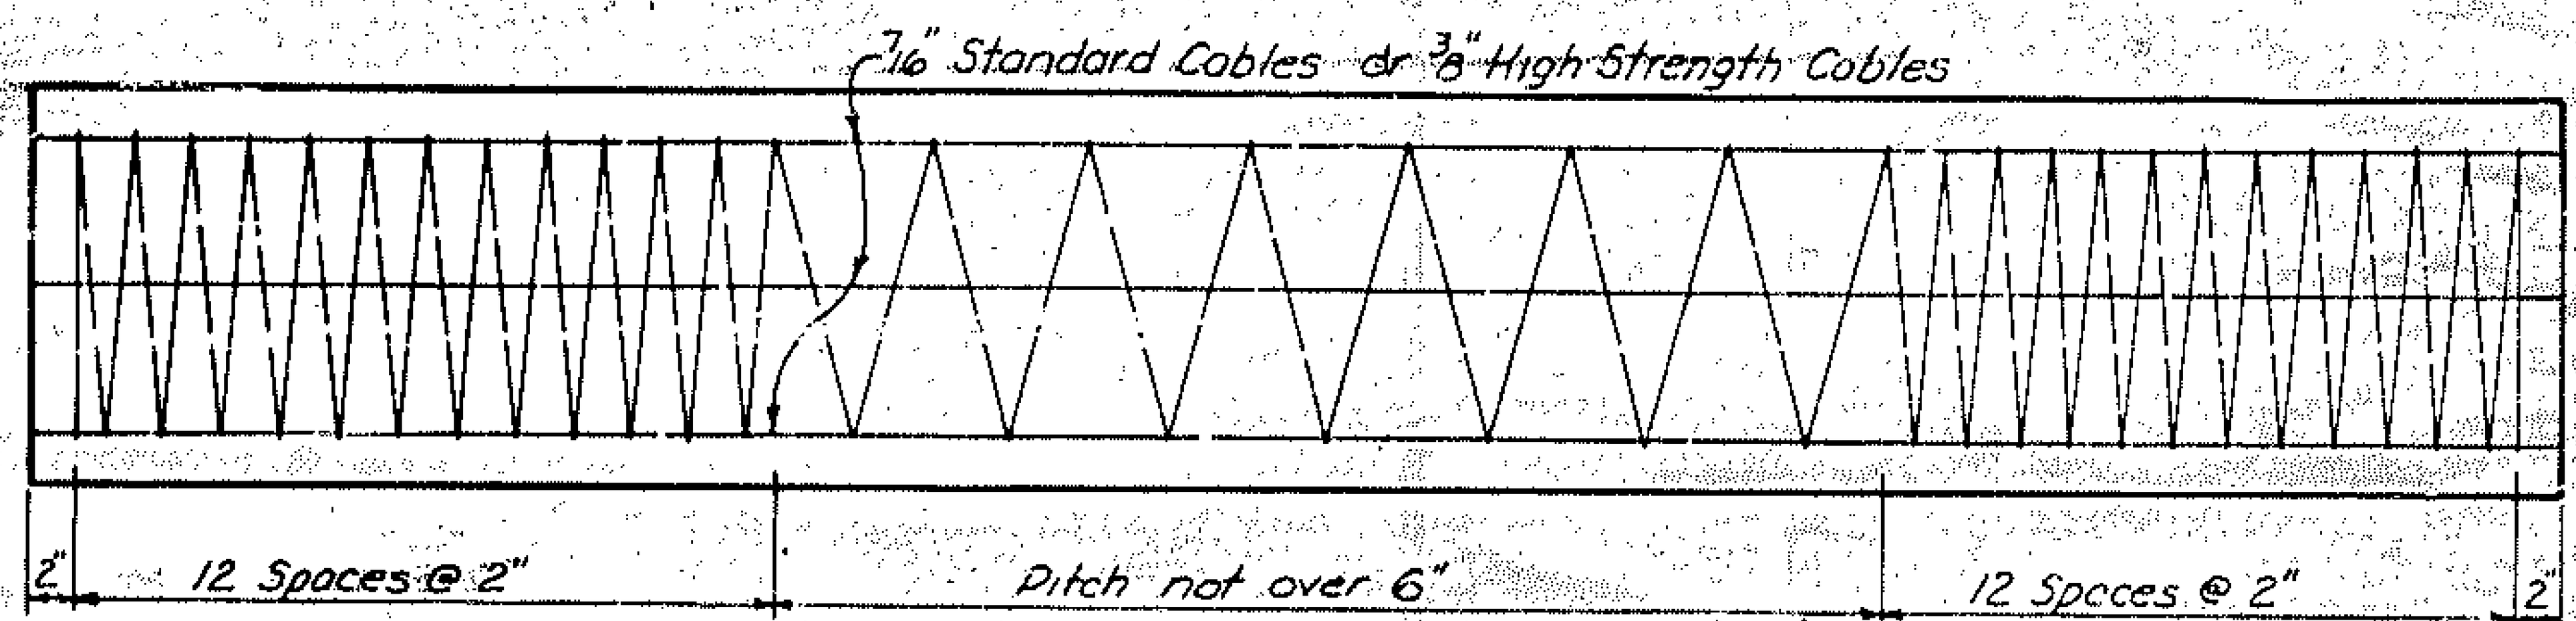


The contractor may use either #2 ties or #7 gage wire spiral as shown

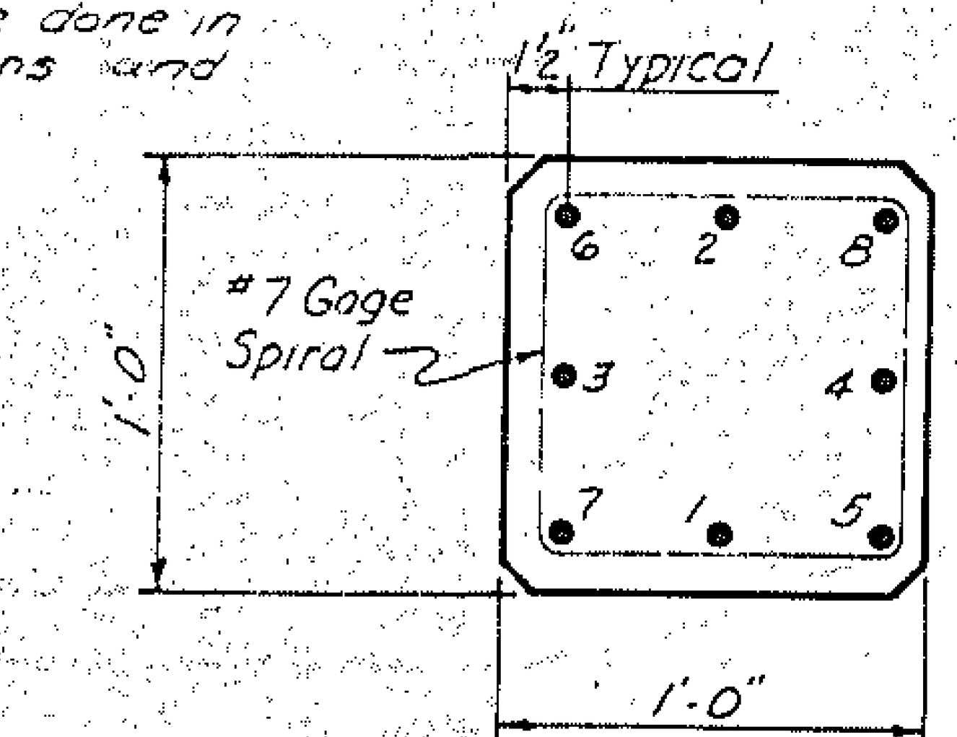


FIELD BUILD-UP USING #2 TIES

Build up where necessary shall be done in accordance with the specifications and Special Provisions.



12"□ PRESTRESSED CONCRETE PILES USING #7 GAGE SPIRAL



If cable stress is to be relieved by burning, the cables shall be burned in pairs in the order shown above. Not more than 4 cables may be burned at any one section before the same cables are burned at both ends of the bed and between each pair of piles in the bed.

TYPICAL PATTERN FOR BURNING CABLES

Design Data:
Concrete: f'c = 5,000 p.s.i. ; fc = 2,000 p.s.i.
Impact in handling = 50%
In driving piles, a method approved by the Engineer shall be used, whereby the head of the pile is not damaged.
All prestressing strand shall be 7-wire stress relieved cables in accordance with the Specifications. The contractor may, at his option, use either of the two types of cable listed below; however, all cables in a pile shall be of the same type:

TYPE	AREA	ULTIMATE STRENGTH	APPLIED PRESTRESSING
3/8" High Strength	0.0840 □"	23,000# per cable	16,100# per cable
7/16" Standard	0.1089 □"	27,000# per cable	18,900# per cable

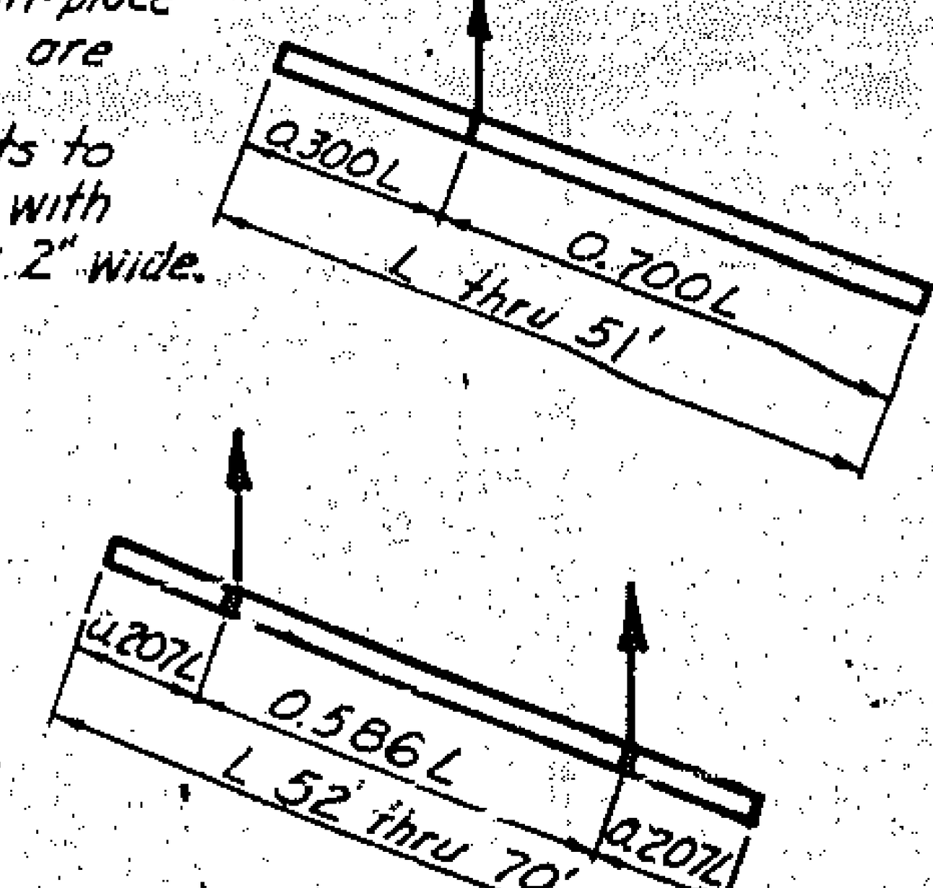
Devices for lifting the piles from the casting beds shall be approved by the Engineer. Where piles will be exposed to view in the structure, inserts set in the piles to receive threaded eye-bolts or similar approved devices shall be used. Loops of cable cast in the pile will not be permitted.

The use of satisfactory clamps or slings will be permitted where this is practicable without the use of lifting devices cast in the piles. After eye bolts or other attachments have been removed, the openings shall be repaired in a satisfactory manner before delivery to the bridge site in order to obtain a uniform appearance. It will not be necessary to remove loops of cable or other lifting devices in piles for End Bents and foundations which will not be exposed to view.

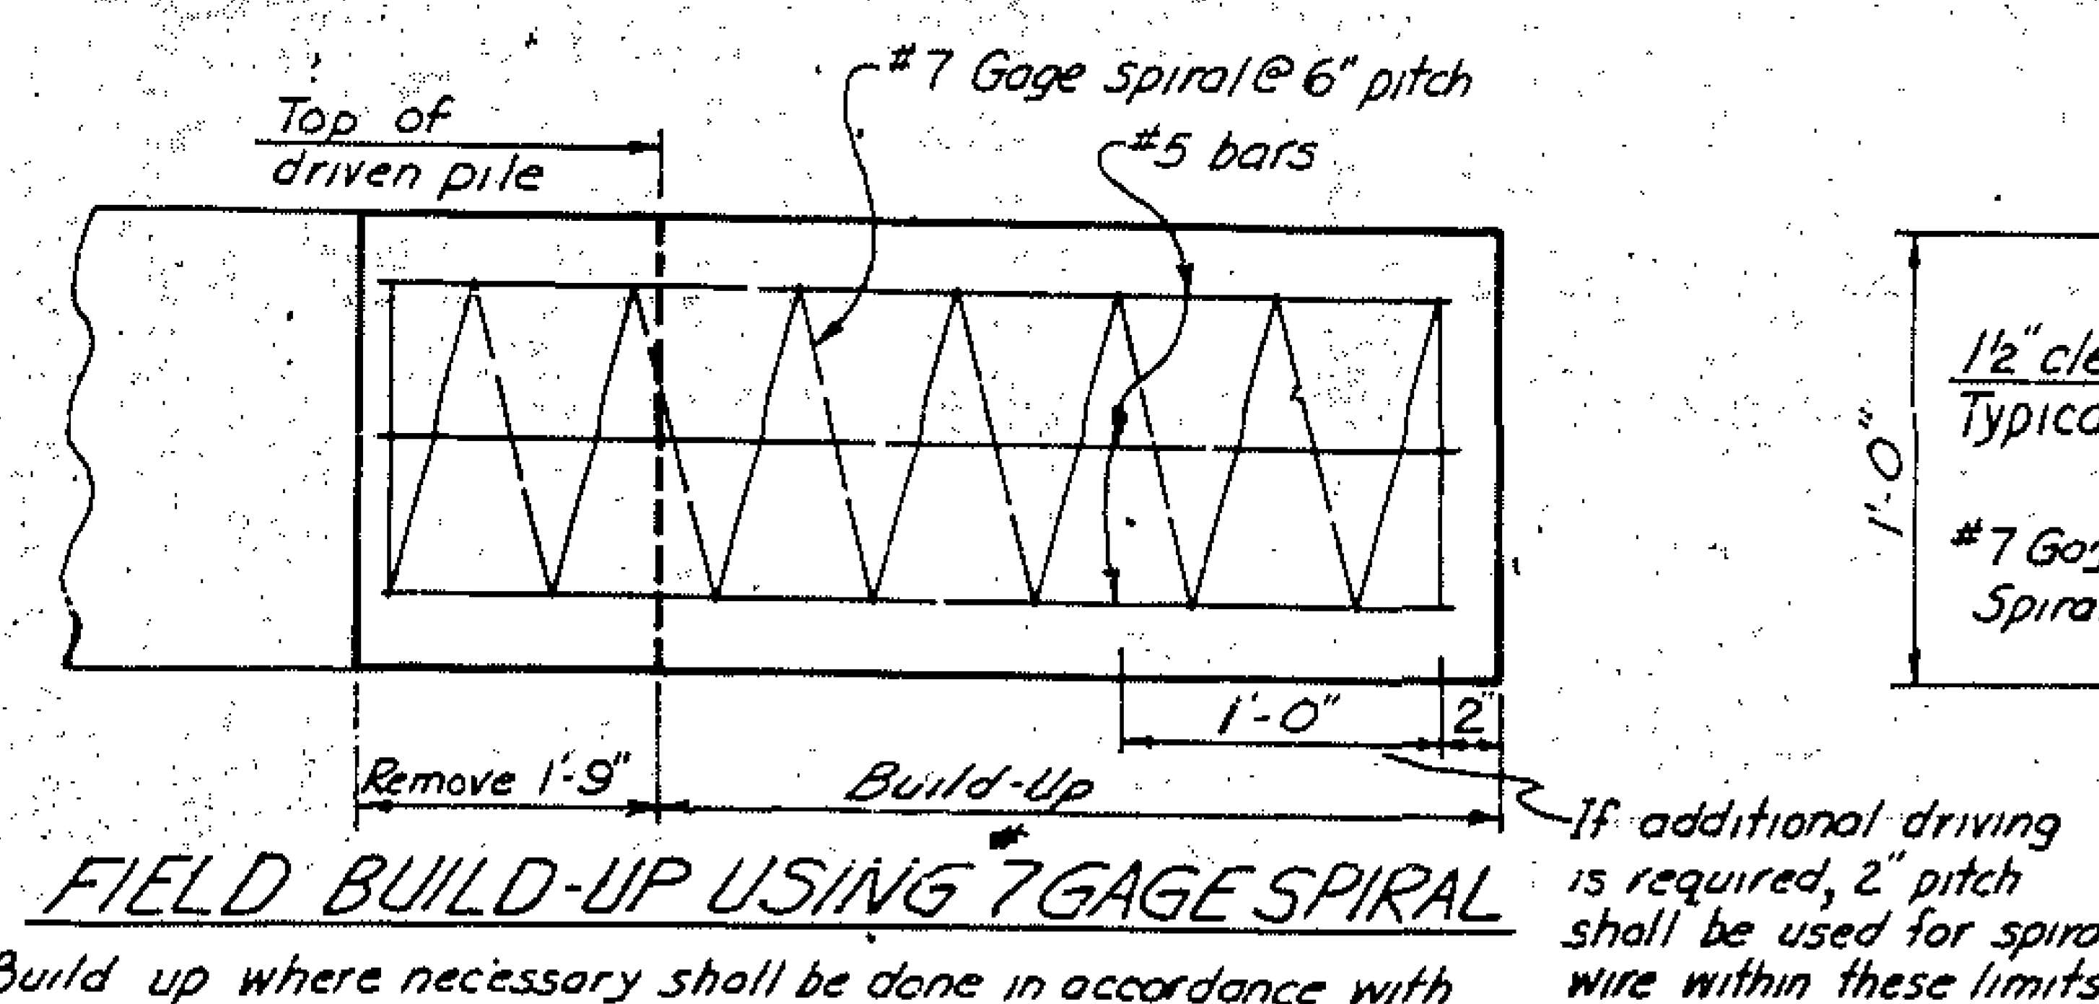
All corners to be chamfered 3/4".

PROJECT No. 8.2215302
CARTERET COUNTY
STATION: 211+20

Where cast-in-place lifting devices are not used, pick-up points to be indicated with a block mark 2" wide.

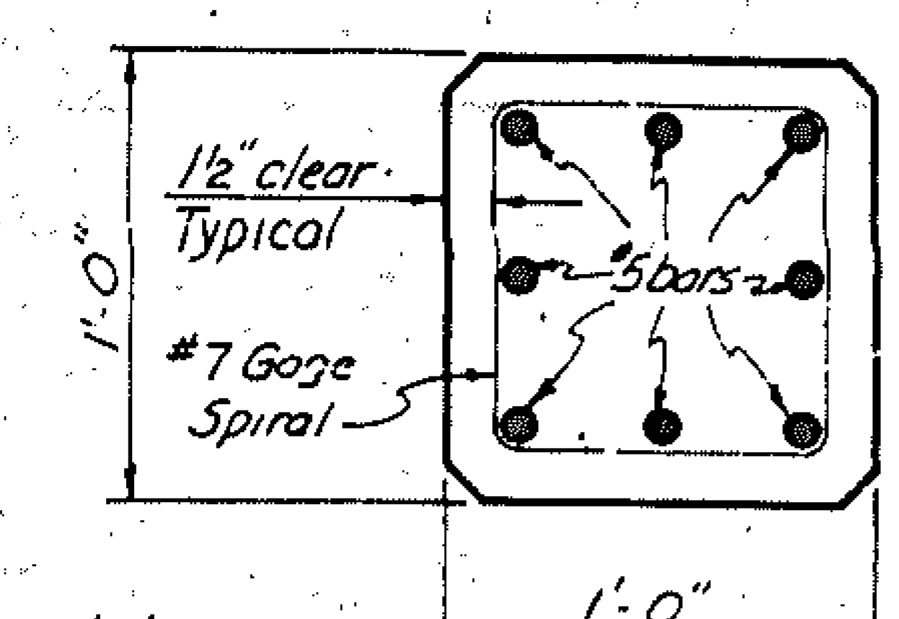


METHOD OF PICKING UP PILES



FIELD BUILD-UP USING #7 GAGE SPIRAL

Build up where necessary shall be done in accordance with the specifications and Special Provisions.



12"□ PRESTRESSED CONCRETE PILES

Revised to add Field Build-Up Using #2 Ties 10-3-66 by C.J.K. ✓ by O.W.R.
Revised for note concerning Field Build-Up. 8/17/66 by C.J.K. ✓ by O.W.R.
Revised for note concerning loops of cable. 5/13/66 by J.M.T. ✓ O.W.R.

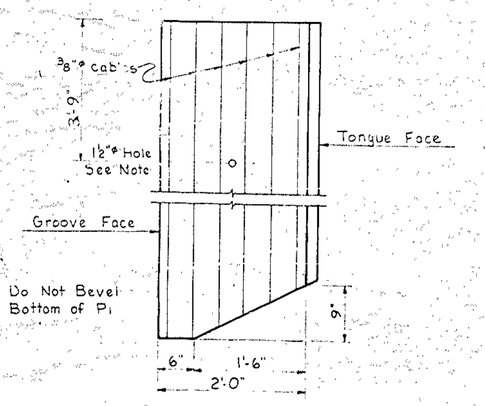
TYPE P3

(TYPE P4 OPPOSITE HAND TO P3)



ELEVATION - SHEET PILE

Note: For convenience in handling the sheet piles the contractor will be required to form a hole not to exceed 1 1/2"ø 3'-9" down from the top of the sheet pile. The holes shall be formed by wood plugs. Remove plugs before concrete has reached final set or by the use of some non-corrosive material. These holes to serve as drains.

NOTES

1. All prestress strands to be 3/8"ø Stress Relieved Cables. Each cable to be prestressed at 14,000 lbs.
2. Concrete: f'c = 5,000 lbs. per square inch.
3. Method "D" Dampproofing to be applied from bottom of cap for 10'-0" each pile.
4. Prestressed Concrete Sheet Piles shall be manufactured, driven and paid for in accordance with the requirements for prestressed concrete piles in Section 207-A of the Specifications.

NOTES:

1. The Navigation Lighting System shall be installed to, and conform with the requirements of the following: (a) Standard Specifications For Road & Bridge Construction, N.C. State Highway Commission, (b) N.F.P.A. No 70, National Electric Code 1965, (c) Aids to Navigation Regulations, United States Coast Guard, CG-208, Jan 1, 1953.

2. The Electrical Contractor shall contact the Power Company and Engineer as to location of service point.

3. The neutral conductor and all non-current carrying parts of the Navigation Lighting System shall be interconnected by a ground wire, (as specified on the plans) & grounded at the equipment pole. The grounding point at the equipment pole shall be the only interconnection between the equipment ground wire and the system ground wire.

4. All conduit to be galvanized.
