CAUTION NOTICE

THE SUBSURFACE INFORMATION AND THE SUBSURFACE INVESTIGATION ON WHICH IT IS BASED WERE MADE FOR THE PURPOSE OF STUDY, PLANNING, AND DESIGN, AND NOT FOR CONSTRUCTION OR PAY PURPOSES. THE VARIOUS FIELD BORING LOGS, ROCK CORES, AND SOIL TEST DATA AVAILABLE MAY BE REVIEWED OR INSPECTED IN RALEIGH BY CONTACTING THE N. C. DEPARTMENT OF TRANSPORTATION, GEOTECHNICAL ENGINEERING UNIT AT (919) 250-4088. NEITHER THE SUBSURFACE PLANS AND REPORTS. NOR THE FIELD BORING LOGS, ROCK CORES, OR SOIL TEST DATA ARE PART OF THE CONTRACT.

GENERAL SOIL AND ROCK STRATA DESCRIPTIONS AND INDICATED BOUNDARIES ARE BASED ON A GEOTECHNICAL INTERPRETATION OF ALL AVAILABLE SUBSURFACE DATA AND MAY NOT NECESSARILY REFLECT THE ACTUAL SUBSURFACE CONDITIONS BETWEEN BORINGS OR BETWEEN SAMPLED STRATA WITHIN THE BOREHOLE. THE LABORATORY SAMPLE DATA AND THE IN SITU (IN-PLACE) TEST DATA CAN BE RELIED ON ONLY TO THE DEGREE OF RELIABILITY INHERENT IN THE STANDARD TEST METHOD. THE OBSERVED WATER LEVELS OR SOIL MOISTURE CONDITIONS INDICATED IN THE SUBSURFACE INVESTIGATIONS ARE AS RECORDED AT THE TIME OF THE INVESTIGATION. THESE WATER LEVELS OR SOIL MOISTURE CONDITIONS MAY VARY CONSIDERABLY WITH TIME ACCORDING TO CLIMATIC CONDITIONS INCLUDING TEMPERATURES, PRECIPITATION, AND WIND, AS WELL AS OTHER NON-CLIMATIC FACTORS.

THE BIDDER OR CONTRACTOR IS CAUTIONED THAT DETAILS SHOWN ON THE SUBSURFACE PLANS ARE PRELIMINARY ONLY AND IN MANY CASES THE FINAL DESIGN DETAILS ARE DIFFERENT. FOR BIDDING AND CONSTRUCTION PURPOSES, REFER TO THE CONSTRUCTION PLANS AND DOCUMENTS FOR FINAL DESIGN INFORMATION ON THIS PROJECT. THE DEPARTMENT DOES NOT WARRANT OR GUARANTEE THE SUFFICIENCY OR ACCURACY OF THE INVESTIGATION MADE, NOR THE INTERPRETATIONS MADE, OR OPINION OF THE DEPARTMENT AS TO THE TYPE OF MATERIALS AND CONDITIONS TO BE ENCOUNTERED. THE BIDDER OR CONTRACTOR IS CAUTIONED TO MAKE SUCH INDEPENDENT SUBSURFACE INVESTIGATIONS AS HE DEEMS NECESSARY TO SATISFY HIMSELF AS TO CONDITIONS TO BE ENCOUNTERED ON THIS PROJECT. THE CONTRACTOR SHALL HAVE NO CLAIM FOR ADDITIONAL COMPENSATION OR FOR AN EXTENSION OF TIME FOR ANY REASON RESULTING FROM THE ACTUAL CONDITIONS ENCOUNTERED AT THE SITE DIFFERING FROM THOSE INDICATED IN THE SUBSURFACE INFORMATION.

SOIL AND ROCK LEGEND, TERMS, SYMBOLS, AND ABBREVIATIONS

SOIL DESCRIPTION

SOIL IS CONSIDERED TO BE THE UNCONSOLIDATED, SEMI-CONSOLIDATED, OR WEATHERED EARTH MATERIALS THAT CAN BE PENETRATED WITH A CONTINUOUS FLIGHT POWER AUGER, AND YIELD LESS THAN 100 BLOWS PER FOOT ACCORDING TO STANDARD PENETRATION TEST (AASHTO T206, ASTM D-1586). SOIL CLASSIFICATION IS BASED ON THE AASHTO SYSTEM. BASIC DESCRIPTIONS GENERALLY SHALL INCLUDE: CONSISTENCY, COLOR, TEXTURE, MOISTURE, AASHTO CLASSIFICATION, AND OTHER PERTINENT FACTORS SUCH AS MINERALOGICAL COMPOSITION, ANGULARITY, STRUCTURE, PLASTICITY, ETC. EXAMPLE:

VERY STIFF, GRAY, SETY CLAY, MOIST WITH INTERBEDDED FINE SAND LAYERS, HIGHLY PLASTIC, A-7-6

SOIL MOISTURE - CORRELATION OF TERMS

SOIL MOISTURE SCALE (ATTERBERG LIMITS)	FIELD MOISTURE DESCRIPTION	GUIDE FOR FIELD MOISTURE DESCRIPTION
	- SATURATED - (SAT.)	USUALLY LIQUID; VERY WET, USUALLY FROM BELOW THE GROUND WATER TABLE
LL — LIQUID LIMIT		
PLASTIC RANGE (PI)	- WET - (W)	SEMISOLID; REQUIRES DRYING TO ATTAIN OPTIMUM MOISTURE
PL — PLASTIC LIMIT		
OM — OPTIMUM MOISTURE	- MOIST - (M)	SOLID; AT OR NEAR OPTIMUM MOISTURE
SL — SHRINKAGE LIMIT		
	- DRY - (D)	REQUIRES ADDITIONAL WATER TO ATTAIN OPTIMUM MOISTURE

PLASTICITY

	PLASTICITY INDEX (PI)	DRY STRENGTH
NONPLASTIC	0-5	VERY LOW
LOW PLASTICITY	6-15	SLIGHT
MED. PLASTICITY	16-25	MEDIUM
HIGH PLASTICITY	26 OR MORE	HIGH

COLOR

DESCRIPTIONS MAY INCLUDE COLOR OR COLOR COMBINATIONS (TAN, RED, YELLOW-BROWN, BLUE-GRAY). MODIFIERS SUCH AS LIGHT, DARK, STREAKED, ETC. ARE USED TO DESCRIBE APPEARANCE.

GRADATION

WELL GRADED - INDICATES A GOOD REPRESENTATION OF PARTICLE SIZES FROM FINE TO COARSE.
UNIFORM - INDICATES THAT SOIL PARTICLES ARE ALL APPROXIMATELY THE SAME SIZE. (ALSO POORLY GRADED)
GAP-GRADED - INDICATES A MIXTURE OF UNIFORM PARTICLES OF TWO OR MORE SIZES.

ANGULARITY OF GRAINS

THE ANGULARITY OR ROUNDNESS OF SOIL GRAINS IS DESIGNATED BY THE TERMS: ANGULAR, SUBANGULAR, SUBROUNDED, OR ROUNDED.

MINERALOGICAL COMPOSITION

MINERAL NAMES SUCH AS QUARTZ, FELOSPAR, MICA, TALC, KAOLIN, ETC. ARE USED IN DESCRIPTIONS WHENEVER THEY ARE CONSIDERED OF SIGNIFICANCE.

COMPRESSIBILITY

SLIGHTLY COMPRESSIBLE	LIQUID LIMIT LESS THAN 31
MODERATELY COMPRESSIBLE	LIQUID LIMIT EQUAL TO 31-50
HIGHLY COMPRESSIBLE	LIQUID LIMIT GREATER THAN 50

PERCENTAGE OF MATERIAL

ORGANIC MATERIAL	GRANULAR SOILS	SILT - CLAY SOILS	OTHER MATERIAL	
TRACE OF ORGANIC MATTER	2 - 3%	3 - 5%	TRACE	1 - 10%
LITTLE ORGANIC MATTER	3 - 5%	5 - 12%	LITTLE	10 - 20%
MODERATELY ORGANIC	5 - 10%	12 - 20%	SOME	20 - 35%
HIGHLY ORGANIC	>10%	>20%	HIGHLY	35% AND ABOVE

ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT IF TESTED, WOULD YIELD SPT REFUSAL. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS. IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELOSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELOSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES 'CLUNK' SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELOSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, YIELDS SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT THE MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE SUCH THAT ONLY MINOR VESTIGES OF THE ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, YIELDS SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FEET
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	> 4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF THE MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.
EXTREMELY INDURATED	SHARP HAMMER BLOWS REQUIRED TO BREAK SAMPLE; SAMPLE BREAKS ACROSS GRAINS.

TERMS AND DEFINITIONS

ALLUVIUM (ALLUV.) - SOILS THAT HAVE BEEN TRANSPORTED BY WATER.

AQUIFER - A WATER BEARING FORMATION OR STRATA.

ARENACEOUS - APPLIED TO ROCKS THAT HAVE BEEN DERIVED FROM SAND OR THAT CONTAIN SAND.

ARGILLACEOUS - APPLIED TO ALL ROCKS OR SUBSTANCES COMPOSED OF CLAY MINERALS, OR HAVING A NOTABLE PROPORTION OF CLAY IN THEIR COMPOSITION, AS SHALE, SLATE, ETC.

ARTESIAN - GROUND WATER THAT IS UNDER SUFFICIENT PRESSURE TO RISE ABOVE THE LEVEL AT WHICH IT IS ENCOUNTERED, BUT WHICH DOES NOT NECESSARILY RISE TO OR ABOVE THE GROUND SURFACE.

CALCAREOUS (CALC.) - SOILS THAT CONTAIN APPRECIABLE AMOUNTS OF CALCIUM CARBONATE.

COLLUVIUM - ROCK FRAGMENTS MIXED WITH SOIL DEPOSITED BY GRAVITY ON SLOPE OR AT BOTTOM OF SLOPE.

CORE RECOVERY (REC.) - TOTAL LENGTH OF ALL MATERIAL RECOVERED IN THE CORE BARREL DIVIDED BY TOTAL LENGTH OF CORE RUN AND EXPRESSED AS A PERCENTAGE.

DIKE - A TABULAR BODY OF IGNEOUS ROCK THAT CUTS ACROSS THE STRUCTURE OF ADJACENT ROCKS OR CUTS MASSIVE ROCK.

DIP - THE ANGLE AT WHICH A STRATUM OR ANY PLANAR FEATURE IS INCLINED FROM THE HORIZONTAL.

DIP DIRECTION (DIP AZIMUTH) - THE DIRECTION OR BEARING OF THE HORIZONTAL TRACE OF THE LINE OF DIP, MEASURED CLOCKWISE FROM NORTH.

FAULT - A FRACTURE OR FRACTURE ZONE ALONG WHICH THERE HAS BEEN DISPLACEMENT OF THE SIDES RELATIVE TO ONE ANOTHER PARALLEL TO THE FRACTURE.

FISSILE - A PROPERTY OF SPLITTING ALONG CLOSELY SPACED PARALLEL PLANES.

FLOAT - ROCK FRAGMENTS ON SURFACE NEAR THEIR ORIGINAL POSITION AND DISLODGED FROM PARENT MATERIAL.

FLOOD PLAIN (FP) - LAND BORDERING A STREAM, BUILT OF SEDIMENTS DEPOSITED BY THE STREAM.

FORMATION (FM.) - A MAPPABLE GEOLOGIC UNIT THAT CAN BE RECOGNIZED AND TRACED IN THE FIELD.

JOINT - FRACTURE IN ROCK ALONG WHICH NO APPRECIABLE MOVEMENT HAS OCCURRED.

LEDGE - A SHELF-LIKE RIDGE OR PROJECTION OF ROCK WHOSE THICKNESS IS SMALL COMPARED TO ITS LATERAL EXTENT.

LENS - A BODY OF SOIL OR ROCK THAT THINS OUT IN ONE OR MORE DIRECTIONS.

MOTTLED (MOT.) - IRREGULARLY MARKED WITH SPOTS OF DIFFERENT COLORS. MOTTLING IN SOILS USUALLY INDICATES POOR AERATION AND LACK OF GOOD DRAINAGE.

PERCHED WATER - WATER MAINTAINED ABOVE THE NORMAL GROUND WATER LEVEL BY THE PRESENCE OF AN INTERVENING IMPERVIOUS STRATUM.

RESIDUAL (RES.) SOIL - SOIL FORMED IN PLACE BY THE WEATHERING OF ROCK.

ROCK QUALITY DESIGNATION (RQD) - A MEASURE OF ROCK QUALITY DESCRIBED BY TOTAL LENGTH OF ROCK SEGMENTS EQUAL TO OR GREATER THAN 4 INCHES DIVIDED BY THE TOTAL LENGTH OF CORE RUN AND EXPRESSED AS A PERCENTAGE.

SAPROLITE (SAP.) - RESIDUAL SOIL THAT RETAINS THE RELIC STRUCTURE OR FABRIC OF THE PARENT ROCK.

SILL - AN INTRUSIVE BODY OF IGNEOUS ROCK OF APPROXIMATELY UNIFORM THICKNESS AND RELATIVELY THIN COMPARED WITH ITS LATERAL EXTENT, THAT HAS BEEN EMPLACED PARALLEL TO THE BEDDING OR SCHISTOSITY OF THE INTRUDED ROCKS.

SLICKENSIDE - POLISHED AND STRIATED SURFACE THAT RESULTS FROM FRICTION ALONG A FAULT OR SLIP PLANE.

STANDARD PENETRATION TEST (PENETRATION RESISTANCE) (SPT) - NUMBER OF BLOWS (N OR BPF) OF A 140 LB. HAMMER FALLING 30 INCHES REQUIRED TO PRODUCE A PENETRATION OF 1 FOOT INTO SOIL WITH A 2 INCH OUTSIDE DIAMETER SPLIT SPOON SAMPLER. SPT REFUSAL IS PENETRATION EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS.

STRATA CORE RECOVERY (SREC.) - TOTAL LENGTH OF STRATA MATERIAL RECOVERED DIVIDED BY TOTAL LENGTH OF STRATUM AND EXPRESSED AS A PERCENTAGE.

STRATA ROCK QUALITY DESIGNATION (SRQD) - A MEASURE OF ROCK QUALITY DESCRIBED BY TOTAL LENGTH OF ROCK SEGMENTS WITHIN A STRATUM EQUAL TO OR GREATER THAN 4 INCHES DIVIDED BY THE TOTAL LENGTH OF STRATA AND EXPRESSED AS A PERCENTAGE.

TOPSOIL (TS.) - SURFACE SOILS USUALLY CONTAINING ORGANIC MATTER.

STATE PROJECT:	34497.1.2 (R-2707C)
FEDERAL PROJECT:	NHF-74(14)
COUNTY:	Cleveland
DESCRIPTION	US 74 Shelby Bypass from West of NC 226 to East of NC 150
SUBJECT:	Geotechnical Report - Inventory

PROJECT DESCRIPTION

This project is located in south central Cleveland County, approximately six miles north of the city of Shelby. The –L- line is on new location for the entire project. Typical sections for the proposed -L- line call for a four-lane roadway with paved shoulders. Median width is 34'. There are three proposed interchanges that will connect the -L- alignment with existing NC 226, existing NC 18, and existing NC 150. A total of seven bridges are included in the scope of this project. Four of these bridges will be required for grade separations at -Y2-, -Y3-, -Y4-, and -Y9- over -L-. A dual structure water crossing is proposed at –L- line over the Broad River. The last two bridges will be required for railroad separation (-L- and -Y11- over -Y13-, CSX RR). The -L- alignment runs generally west to east. The following alignments were investigated:

Line	Station(s)
-L-	351+75.00 to 635+00.00 (5.38 miles)
Ramp A (RP A1) at NC 226	0+00.00 to 21+11.85 (0.40 miles)
Ramp D (RP D1)at NC 226	0+00.00 to 23+72.31 (0.45 miles)
Loop A (LP A1) at NC 226	0+00.00 to 11+20.63 (0.21 miles)
Loop D (LP D1) at NC 226	0+00.00 to 11+72.36 (0.22 miles)
Ramp A (RP A2) at NC 18	0+00.00 to 20+93.98 (0.40 miles)
Ramp B (RP B2) at NC 18	0+00.00 to 19+96.30 (0.38 miles)

-Y17- at SR 1	10+20.47 to 38+40.15 (0.53 miles)

The total length of lines investigated is 13.54 miles.

The initial field investigation was conducted between October 2005 and April 2006. Borings were conducted with a CME-550 drill machine with an automatic hammer. Standard Penetration Tests were conducted at selected locations utilizing hollow stem augers and additional borings were advanced with 6" continuous flight augers. Various hand tools (hand auger, drive rods) and visual reconnaissance completed the investigation. Numerous soil samples were submitted to the Materials and Tests Unit for laboratory analysis.

AREAS OF SPECIAL GEOTECHNICAL INTEREST

Crystalline Rock: There is a considerable amount of hard rock on the project. Rock was encountered above or within 10' of the proposed grade at the following locations:

Line	Station(s)
-L-	355+00 to 358+00
-L-	360+50 to 362+50
-L-	377+00 to 379+00
-L-	388+00 to 402+50
-L-	412+50 to 413+00
-L-	417+00 to 421+50
-L-	423+00 to 424+00
-L-	428+50 to 438+50
-L-	439+50 to 446+50
-L-	447+50 to 450+00
-Loop A1-	1+50 to 4+50
-Ramp A1-	14+00 to 16+00
-Loop D1-	0+25 to 2+75

The rock lines depicted on the attached cross-sections and profiles are interpolated between borings and based primarily on 8" hollow stem auger and 6" standard auger refusal. Four core borings were performed in the rock cut encountered between Stations 388+00 to 402+50 –L-. The Mica Gneiss encountered in those borings had RQD's between 21% and 100%. These borings also confirmed what the Geologic map of North Carolina had indicated would be present in the area.
In addition, there are zones of weathered rock and/or layers with alternating very hard residual soils and weathered rock that occur above the depicted rock lines. According to the Geologic map of North Carolina and our core borings, the most likely rock type within the project corridor is Biotite/Mica Gneiss metamorphic rock (CZms & CZbg). These rocks are likely to become more schistose on the western end of the project near NC 226. The rock is described on the cross-sections and profiles as *Hard Crystalline Rock – Biotite/Mica Gneiss.* As stated previously, the hardness was determined on 8" hollow stem auger refusal, 6" standard auger refusal, and core borings. In addition, the pull down pressure on the feed cylinders on the CME-550 was observed to be 800 - 1000 psi in the areas of Hollow Stem/Standard Auger refusal.

Alluvial Soils; Areas with significant alluvial deposits are discussed below.

Station 365+65 to 366+35 –L-, Left; Alluvial soils present in this location are associated with a topographical low area that- serves as a drainage feature for the surrounding pasture. The deposit is approximately eight feet thick and contains very soft to medium stiff sandy silt (A-4) and very loose coarse sand (A-1-b). At the time of our investigation, groundwater was not encountered in the two borings performed in this area.

Station 382+90 to 386+05 -L-; The alluvial deposits in this segment are associated with the Broad River Floodplain. A dual four-lane structure has been proposed for this water crossing. No borings were performed in this interval during our Roadway investigation. These alluvial soils will be addressed in detail during the subsequent structure investigation.

Station 503+20 to 509+00 –L-, Left; Alluvial soils present in this location are associated with a small stream that intersects the -Y5- alignment near Station 17+00. The stream continues in an easterly direction running parallel to the -L- line at an offset of 50' - 120'. The deposit is eight to 10' thick and contains primarily very loose to loose, silty, coarse and fine sand (A-2-4). At the time of our investigation, groundwater was encountered in this area between elevations 840' and 845'.

Station 538+15 to 539+15 -L- and 6+70 to 7+40 -Ramp D2-; Alluvial soils present in this location are associated with a small stream that drains the area north of existing Carter Road. The stream moves in a southerly direction while bisecting the proposed -L- line and -Ramp D2-. The deposit is six to seven feet thick and contains medium stiff sandy silt (A-4), loose to medium dense silty sand (A-2-4), and soft sandy clay (A-6). At the time of our investigation, groundwater was encountered in this area between elevation 875' and 890'.

563+90 to 566+20 -L-; This pond is formed by an earthen dam located right of -L- centerline and fed by surface drainage from the northeast. It is also possible that a spring located outside the construction limits could be feeding the pond as well. Please refer to plan sheet 21 of the attached inventory plans for a graphical depiction of this area. The residual soils encountered in the immediate area around the pond consist of moderate to highly plastic, medium stiff to stiff sandy clays (A-7). No alluvial soils were encountered around the pond. Based on the residual soils immediately adjacent to the pond, we estimate up to three feet of wet plastic soils in the bottom of the pond.

Wells: Wells were encountered within 100' of the project corridor at the following locations:

Line	Station(s)	Offset
-L-	584+00	155' Rt.
-L-	584+75	115 Lt.
-L-	599+70	120 Rt.
-L-	608+90	55' Lt.

Plastic Clays: Highly Plastic clays (P1.≥ 26) were encountered with six feet of proposed grade at the following locations:

Line	Station(s)	P.I.
-L-	559+50 to 561+00	38
-L-	569+00 to 573+40	36
-L-	459+25 to 460+75	31-39
-L-	497+50 to 501+00	29-35
-L-	582+30 to 583+40	33
-Y4-	21+50 to 25+50	27
-RPB2-	15+35 to 17+35	34
-Y8REV-	10+75 to 14+15	31
-Y8REV-	18+50 to 26+10	26-43
-RPA3-	7+20 to 8+55	30
-RPC3-	11+50 to 14+00	36
-LPC3-	6+00 to 8+66	36
-Y11REV-	49+15 to-50+50	30

Highly Plastic cap clays (PI. ≥ 26) were encountered in the following cut sections:

Line	Station(s)	P.I.
-LPA1-	5+50,60' Lt.	29
-RPA1-	7+50 to 9+00	26
-L-	396+50 to 401+50	29
-L-	418+00 to 420+00	39
-L-	525+00 to 532+00	35
-L-	468+25 to 469+50	28
-L-	479+25 to 480+30	26
-L-	483+50 to 487+25	40

PHYSIOLOGRAPHY AND GEOLOGY

The project is located in the southwestern piedmont region of North Carolina. The terrain is rolling hills and steep valleys with generally narrow floodplains at stream crossings. Elevation relief (from highest point to lowest point) within the entire project corridor is approximately 245'. The majority of the project is open land but there are areas where homes and businesses will be affected. .Most of the wooded areas encountered in our investigation had not been logged. The entire project is within the southwestern Inner Piedmont Geological Belt. Please refer to the section above entitled "Crystalline Rock" for a more detailed description of anticipated rock types within the project corridor.

SOIL PROPERTIES

Residual Soils

All residual soils on the project are derived from the Biotite/Mica Gneiss rocks previously discussed. The dominant soil types encountered are silty and sandy clay (A-6, A-7), silty sand (A-2-4, A-l-b) and sandy silts (A-4, A-5). In areas where rock above grade was encountered, the clays tended to be cap clays extending up to 10' below the ground surface. It is in these areas of hard rock that the predominant soil is silty sand (A-2-4) with alternating zones of dense residual soil and weathered rock. A large majority of the residual silty sands encountered on this project were observed to be micaceous.

CULVERTS

Station 453+03 -L-

The proposed structure is a 2 @ 7' x 7" RCBC, Overall length = 3247. Five test borings were conducted in the vicinity of the proposed structure. The floor elevation, moving left to right, varies from 768.40' to 772.30'. The borings indicate that sandy residual soils are present near the proposed floor elevation. Weathered rock was encountered between elevation 761 '-766' in the three closest borings to the structure. Floodplain soils in the area consist of clayey and silty sands approximately ten feet or less in thickness.

Station 553+29 -L-

The proposed structure is a 2 @ 8' x 7' RCBC, Overall length = 330'. Two borings conducted in the vicinity indicate the top of residual soil between elevation 861 '- 866'. The proposed culvert has an inlet elevation = 864.8' and an outlet elevation = 861.0'. Three to nine feet of alluvial silts were present across this location. The culvert will be founded primarily on residual soil consisting of soft -to medium stiff sandy silt and very loose silty sand. We estimate very soft to soft alluvial silts extending down to elevation 860.50' at Station 553+50 -L-, 55' Lt. Neither weathered nor hard rock was encountered at this location.

Groundwater: Groundwater can occur at or very near the ground surface in floodplain areas. Groundwater will also be present in some of the cut sections. The profiles and cross-sections in the areas of rock above grade could be misleading because most of the auger borings did not penetrate deep enough to reach proposed grade. We anticipate that groundwater could occur above proposed grade in the following intervals:

6 of 36

Line	Station(s)
-L-	358+00 to 361+00
-L-	421+50 to 422+50
-L-	467+50 to 471+00
-L-	481+00 to 485+00
-L-	525+00 to 531+00
-Ramp A1-	1+00 to 8+00
-Loop Al-	4+00 to 8+00

Artificial Fill/Roadway Fill:

Station 613+ 15 to 616+75 —L-: This interval falls within the proposed interchange of alignment -L- and NC 150 at the easternmost portion of the project. The artificial fill soils encountered in this segment are approximately three to 11' thick and consist primarily of stiff to very stiff sandy clay (A-7, A-6). Please refer to Plan Sheet 25 of the attached Inventory Plans to view the extent of these soils left and right of centerline -L-. All other soils encountered in the immediate vicinity of these fill materials were residual clays. In addition, this area is currently being used by the NCDOT as a place to stockpile soil for use in road building activities. Due to the extremely dynamic nature of the materials that are either being taken out or brought in, none of the stockpiles we observered at the time of our investigation were mapped.

Due to the presence of utilities and high traffic volumes, none of the existing roadway fill soils along any of the proposed alignments were investigated by drilling. However, visual reconnaissance of side slopes and existing pavement was performed. No problems were observed with the existing roadway soils except for some minor erosion on the steeper side slopes.

Ponds: Three ponds were encountered within the project corridor at the following locations:

439+00 –L-, 160' right. This pond is approximately 60' south of the slope stake line at this location. The drainage outlet for this pond bisects the -L- line at Station 438+90 –L-. Alluvial soils associated with this drainage path are estimated to be five feet thick. Based on the rock line in the two cuts adjacent to this stream, we estimate that hard rock will be encountered below the stream between elevation 780' and 785'.

503+50 -L-, 100' right. At the time of our investigation, this pond had been drained. The water feeding into the pond appears to be coming primarily from surface drainage. It is also possible that a spring located outside the construction limits could be feeding the pond as well. Three to 11' of alluvial materials were encountered at the edge of the pond and downstream of the outlet, respectively. These materials consist of very loose silty sands (A-2-4) and very soft silt clays (A-7). Please refer to the attached profiles and cross-sections for a detailed, graphical depiction of this area.
