ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE THAT ONLY MINOR VESTIGES OF ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FOOT
VERY CLOSE	LESS THAN 0.16 FEET

TERM	THICKNESS
VERY THICKLY BEDDED	4 FEET
THICKLY BEDDED	1.5 - 4 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

PREFACE

This roadway subsurface investigation was conducted between September 8th and September 16th, 2014 in general accordance with our Proposal to Provide Geotechnical Engineering Services, dated December 2, 2013 (Proposal No.: F2012-045R1). The recommendations provided in this report are based solely on our site reconnaissance, soil test borings and laboratory test data, engineering evaluation of these data, and generally accepted soil and foundation engineering practices and principles.

A total of thirty-nine (39) Standard Penetration Test (SPT) borings were drilled for the new roadway alignments. All SPT borings were drilled using a CME-550X all-terrain-vehicle (ATV) mounted drill rig equipped with 2 ¼-inch inside diameter hollow-stem augers and an automatic hammer. Four (4) additional hand auger borings with rod soundings were performed where SPT borings were offset significantly from centerline to develop a comprehensive cross section of subsurface conditions. Representative soil samples, collected with a split-barrel sampler, were selected for laboratory testing to verify visual field classifications. In addition, bulk samples were collected for additional laboratory testing for use in our geotechnical engineering analyses.

Falcon appreciates the opportunity to have provided our geotechnical engineering services for the above referenced project. If you have any questions concerning the contents of this report or need additional information, please do not hesitate to contact our office.

SUBJECT: Roadway Subsurface Investigation – Inventory

PROJECT DESCRIPTION

This project consists of a portion of the Morrisville Parkway extension from the end of an existing section west of NC 540 near Westfalen Drive to NC 55 in western Wake County, North Carolina. The project has been divided into three sections, and the section which has been investigated for this report extends from station 57+00 to 82+55 -L- (-MPE3-). Beyond these limits on -L- (-MPE3-) design and investigation is the responsibility of others. The project also includes a new partial cloverleaf interchange with NC 540 and the corresponding alignments listed below for ramps and loops in two quadrants. In addition, Twyla Road (SR 3068) will be partially relocated along -Y1- in the same vicinity of the existing alignment to provide an intersection with Morrisville Parkway. All other alignments will consist of new location roadway constructed through what are currently heavily wooded, residential, and agricultural lands. A bridge structure and associated approach embankments have been previously constructed spanning NC 540 as part of the NC 540 construction. The bridge will carry the planned two lane section of -L- across NC 540 with a future matching structure planned to create duals as needed to facilitate a four lane section. The planned alignments cross a few small waterways which will be facilitated by pipe crossings. A reinforced concrete box culvert (RCBC) is planned near station 83+50 -L- beyond the limits of our investigation. An onsite detour -Y1DET- is also planned near -Y1-, for which no investigation was scoped. The following alignments, totaling approximately 10,612 feet (2.01 miles) were explicitly investigated.

Alignment	Station
-L- (Morrisville Parkway)	57+00.00 – 82+55.00
-Y1- (Twyla Road)	10+00.00 – 23+46.90

The following sections contain cohesive soils which have the potential to cause embankment or subgrade stability problems during construction:

Station
57+00 to 81+50, -L-
12+00 to 21+02.62, -LPB-
14+00 to 29+30.63, -RPB-
13+00 to 22+88.66, -LPD-
15+00 to 30+33.64, -RPD-
10+00 to 19+50.00, -Y1-

Shallow ground water was measured within the following areas and may cause groundwater related stability problems during construction:

Station
61+00 to 66+00 -L-
73+00 to 83+00 -L-
12+00 to 15+00 -LPB-
13+00 to 16+00 -LPD-
22+00 to 23+00 -LPD-
15+00 to 24+00 -RPD-
29+00 to 31+00 -RPD-
11+00 to 13+00 -Y1-

Alluvial soils and natural waterways, seasonally high groundwater, perched water, and/or surficial water due to poor drainage was observed in the areas below. The potential for wet, soft or organic soils should be anticipated in these areas.

PHYSIOGRAPHY AND GEOLOGY

The project site is in the western portion of the Coastal Plain Physiographic Province of North Carolina. According to the ***Geologic Map of North Carolina*** (1985), the site is underlain by the Chatham Group, Undivided (TRc) of the Triassic Basin Formation in the Piedmont Physiographic Province. This unit is noted to consist of conglomerate, fanglomerate, sandstone and mudstone. Residual soils encountered indicate a geologic setting consistent with the published data.

Existing site topography is gently sloping with some steep slopes near creeks; typical of this area of the piedmont region. Predominantly wide and shallow drainage swales parallel existing roadway alignments, and carry roadway drainage toward various natural drainage features and creeks. Topography is relatively flat in agricultural areas within the project corridor.

Large cut slopes exist on the project corridor near NC 540 which the proposed ramps for the interchange will traverse. These slopes were observed at 3:1 (HV) or shallower and appeared to be stable within the vicinity of the proposed corridor. Some exposed weathered rock was observed along these cut slopes. Subsurface cross sections depict the top of weathered rock day lighting into the cut slopes where appropriate.

SOIL PROPERTIES

A variety of soils were encountered along the project, including existing roadway embankments, alluvial deposits, and Triassic residual soils, weathered rock, and intrusive crystalline rock.

Roadway Embankment soils were encountered at the ground surface or beneath existing pavements in and adjacent to existing roadways. These consist of 1.5 to 3 feet of dry to wet, very loose to medium dense, clayey and silty sand (A-2-4, A-2-6) and medium stiff to stiff, sandy clay and silt (A-4, A-6) with trace gravel.

Alluvial soils were encountered at the ground surface in a few locations. These soils were found at the ground surface and beneath embankment materials to depths of approximately 8.5 feet deep and consist of dry to wet, very loose to medium dense, silty sand and poorly-graded sand (A-2-4, A-1-b) with trace amounts of organic material.

Triassic Residual soils were encountered at the ground surface, or beneath roadway embankment and/or alluvial soils. These soils consist of dry to wet, loose to very dense, clayey and silty sand (A-2-6, A-2-4) and medium stiff to hard, fine sandy clay and silt and silty clays (A-4, A-6, A-7).

Weathered rock was encountered in many borings throughout the project area at depths of 0.5 feet to 21 feet, consisting of red-brown, tan, gray, blue, and purple, Triassic Siltstone and Triassic Sandstone. Some borings were terminated before encountering weathered rock, at depths of up to 25 feet. Many of the borings were terminated in weathered rock before non-crystalline rock was encountered. However, intrusive crystalline rock was encountered at two locations (along -Y1-, and near the roundabout where -LPD-, -RPD-, and -L- intersect). This material consisted of black, gray, and brown Intrusive Diabase, likely part of a dike formation, and was encountered at 14 to 20 feet below existing ground. The presence of other Diabase dikes or other formations within the project limits is also likely.

GROUNDWATER PROPERTIES

Groundwater levels were measured at the time of boring completion, and in some cases after a waiting period of at least 24 hours. Borings drilled within and in close proximity to existing roadways, and within residential areas were backfilled immediately after completion due to safety considerations.

The project crosses small streams and tributaries as well as natural drainage ditches. Groundwater was observed at shallow depths near these streams and in low lying areas. In addition, perched and/or static groundwater was encountered in proposed cut areas and will likely be encountered during site excavation. Detailed groundwater measurements are included in the attached subsurface profiles and cross sections.

The ground surface between 72+55 and 72+82 -L-, was saturated with standing water in the area at the time of our investigation due to poor drainage. Perched water and/or shallow groundwater, flowing surface water, and saturated, soft soils are likely to be encountered in this area during construction.
