

**PROJECT SPECIAL PROVISIONS
GEOENVIRONMENTAL**

CONTAMINATED SOIL (6/24/2021)

The Contractor's attention is directed to the fact that soil contaminated with petroleum hydrocarbon compounds may exist within the project area. The known areas of contamination are indicated on corresponding plans sheets. Information relating to these contaminated areas, sample locations, and investigation reports will be available at the following web address by navigating to the correct letting year and month then selecting, "Plans and Proposals", "R-5819", "Individual Sheets/520 GeoEnvironmental":

<http://dotw-xfer01.dot.state.nc.us/dsplan/>

Petroleum contaminated soil may be encountered during any earthwork activities on the project. The Contractor shall only excavate those soils that the Engineer designates necessary to complete a particular task. The Engineer shall determine if soil is contaminated based on areas shown on the plans, petroleum odors, and unusual soil staining. Contaminated soil not required to be excavated is to remain in place and undisturbed. Undisturbed soil shall remain in place, whether contaminated or not. The Contractor shall transport all contaminated soil excavated from the project to a facility licensed to accept contaminated soil.

In the event that a stockpile is needed, the stockpile shall be created within the property boundaries of the source material and in accordance with the Diagram for Temporary Containment and Treatment of Petroleum-Contaminated Soil per North Carolina Department of Environmental Quality's (NCDEQ) Division of Waste Management UST Section GUIDELINES FOR EX SITU PETROLEUM CONTAMINATED SOIL REMEDIATION. If the volume of contaminated material exceeds available space on site, the Contractor shall obtain a permit from the NCDEQ UST Section's Regional Office for off-site temporary storage. The Contractor shall provide copies of disposal manifests completed per the disposal facilities requirements and weigh tickets to the Engineer.

Measurement and Payment:

The quantity of contaminated soil hauled and disposed of shall be the actual number of tons of material, which has been acceptably transported and weighed with certified scales as documented by disposal manifests and weigh tickets. The quantity of contaminated soil, measured as provided above, shall be paid for at the contract unit price per ton for "Hauling and Disposal of Petroleum Contaminated Soil".

The above price and payment shall be full compensation for all work covered by this section, including, but not limited to stockpiling, loading, transportation, weighing, laboratory testing, disposal, equipment, decontamination of equipment, labor, and personal protective equipment.

Payment shall be made under:

1.0 INTRODUCTION

The North Carolina Department of Transportation (NCDOT) authorized GEL Engineering of NC, Inc. (GEL), to perform a Phase II GeoEnvironmental Investigation at the subject parcel in Columbus County. The objective of the investigation was to evaluate the presence of potential environmental hazards within the existing and proposed rights-of-way (ROWs) and/or easements, including objects such as underground storage tanks (USTs) and petroleum contaminated soil. The subject parcel location is shown on Figure 1 and listed below.

Parcel #	Owner	Address	Columbus County PIN #
7	Boys & Girls Home of NC	8603 Sam Potts Hwy (108 West Old 74-76) Lake Waccamaw	1240.01-38-8270.000

A portion of the parcel was designated as the investigation area from information included in NCDOT's R-5819 CAD files and input the NCDOT GeoEnvironmental Project Manager provided to GEL. This area is shown on Figure 2 and extends from the edge-of-pavement to the innermost existing or proposed ROW or easement. Geophysical surveys were conducted across the investigation area using ground penetrating radar (GPR) and time-domain electromagnetic (TDEM) technologies. Three geoenvironmental soil borings were installed within the investigation area at the locations shown on Figure 3. The methodologies and results of these investigations are discussed in the following sections.

In addition to the electronic DocuSign copy of this report, GEL is submitting to NCDOT (a) an electronic MicroStation R5819_Geo_env.dgn file that provides the geoenvironmental soil boring locations and the positions of monitoring wells identified within the investigation area, and (b) a Microsoft Excel file of the soil sample ultra-violet fluorescence (UVF) spectrometry analytical results prepared by RED Lab, LLC, of Wilmington, North Carolina (RED Lab).

2.0 HISTORY

The NCDOT Geotechnical Engineering Unit's Revision #2 Phase I GeoEnvironmental Planning Report for the R-5819 project dated August 21, 2019, includes the following description of the Phase I research and field investigation of Parcel #7:

This site is currently a vacant lot. It is the former location of 74 Shell/Waccamaw Service Center. It is located on the north side of Sam Potts Hwy approximately 400 feet west of Chauncey Town Rd. According to the UST Section Registry four (4) tanks were removed in 1993. Incident # 10044 is associated with this facility and was closed out in 2003. One monitoring well was observed during the site investigation near the former UST location. The well could not be accessed and appeared to be abandoned.

GEL searched North Carolina Department of Environmental Quality (NCDEQ) electronic records and contacted the NCDEQ Wilmington Regional Office and NCDEQ Headquarters in Raleigh to obtain pertinent environmental records and regulatory history. Through these efforts, GEL obtained and reviewed 11 documents associated with removal of the four USTs and Incident #10044. A petroleum release was observed in February 1993 upon removal of four gasoline tanks: one 6,000-gallon UST, two 1,500-gallons USTs, and one 1,000-gallon UST. These USTs had been situated just north of the eastern portion of the current investigation area. The North Carolina Department of Environment, Health, and Natural Resources (NCDENR, now NCDEQ) assigned Incident #10044 a priority ranking D, which is the second to lowest priority rankings. A Phase 1/Phase 2 Limited Site Assessment Report dated November 2002, a Soil Assessment Report (SAR) dated March 2003, and an SAR Addendum dated April 2003 that document soil impacts did not require corrective action. Groundwater impacts exceeding North Carolina Groundwater Quality Standards (15A NCAC 2L .0202) were identified, with groundwater flow directions measured generally to the southwest. Due to the groundwater contamination, a Notice of Residual Petroleum was filed with the Columbus County Register of Deeds on May 5, 2003, and NCDENR issued a Notice of No Further Action on May 7, 2003.

3.0 SITE OBSERVATIONS

In advance of the field investigation, the GEL Project Manager provided notice of the planned investigation activities to the property owner listed in Section 1.0 by United States Postal Service mail. Upon commencement of field activities, the GEL Project Manager conducted a site reconnaissance, and no features of potential environmental concern were observed within the investigation area other than the concrete slab associated with the former pump dispenser island. A monitoring well with a tight-fitting cap installed within the concrete slab was observed. According to the documents discussed in Section 2.0, this monitoring well was most recently referred to as "DMW-1" and previously referred to as "MW-6D". GEL measured the depth of this well at 45.4 feet and the depth to groundwater at 8.45 feet. A buried abandoned monitoring well was unearthed about 7 feet east of DMW-1, and the documents discussed in Section 2.0 identify this well as "MW-2". An active BP gas filling station is located east of subject parcel #7 on parcel #8, and the UST tank farm for that facility is situated just across the property line. No significant obstructions to the geophysical survey or soil boring program were present across the investigation area. Representative photographs taken during the site reconnaissance are provided in Appendix A.

4.0 METHODS

This section describes the field methods followed to complete the geophysical surveys and the geoenvironmental soil boring and sampling program.

4.1 Geophysical Survey Methods

The geophysical evaluation included the deployment of GPR and TDEM technologies to the site. These technologies were used in concert with one another to identify the presence of potential USTs or other subsurface features of concern such as buried drums. A brief description of these technologies is presented in the following paragraphs.

The GPR and TDEM surveys were conducted by towing the geophysical equipment along a system of transect lines on an approximately 2.5-foot spaced grid established within the investigation area. In spatially restricted and surface obstructed areas, a modified pattern of transect lines was implemented to maximize data acquisition. Positioning for the investigation was provided using a Trimble real-time kinematic (RTK) global positioning system (GPS).

4.1.1 Ground Penetrating Radar Methodology

An ImpulseRadar Crossover dual-channel digital radar control system configured with a 400- and 800-Megahertz (MHz) antenna array was used in this investigation. GPR is an electromagnetic geophysical method that detects interfaces between subsurface materials with differing dielectric constants. The GPR system consists of an antenna which houses the transmitter and receiver, a digital control unit which both generates and digitally records the GPR data, and a color video monitor to view data as it is collected in the field.

The transmitter radiates repetitive short duration electromagnetic waves (at radar frequencies) into the earth from an antenna moving across the ground surface. These radar waves are reflected back to the receiver from the interface of materials with different dielectric constants. The intensity of the reflected signal is a function of the contrast in the dielectric constant between the materials, the conductivity of the material through which the wave is traveling, and the frequency of the signal.

Subsurface features that commonly cause such reflections are: 1) natural geologic conditions, such as changes in sediment composition, bedding, and cementation horizons and voids; or 2) unnatural changes to the subsurface such as disturbed soils, soil backfill, buried debris, tanks,

pipelines, and utilities. The digital control unit processes the signal from the receiver and produces a continuous cross-section of the subsurface interface reflection events.

GPR data profiles were collected along transects covering the entire investigation area. Depth of investigation of the GPR signal is highly site specific and is limited by signal attenuation (absorption) in the subsurface materials. Signal attenuation is dependent upon the electrical conductivity of the subsurface materials. Signal attenuation is greatest in materials with relatively high electrical conductivities such as clays, brackish groundwater, or groundwater with a high dissolved solid content from natural or manmade sources. Signal attenuation is lowest in relatively low conductivity materials such as dry sand or rock. Depth of investigation is also dependent on the antenna's transmitting frequency. Depth of investigation generally increases as transmitting frequency decreases; however, the ability to resolve smaller subsurface features is diminished as frequency is decreased. The average depth of penetration at this site was approximately 4 feet below the surface.

The GPR antenna used at this site is internally shielded from aboveground interference sources. Accordingly, the GPR response is not affected by overhead power lines, metallic buildings, or nearby objects.

4.1.2 Time Domain Electromagnetic Methodology

TDEM methods measure the electrical conductivity of subsurface materials. The conductivity is determined by inducing (from a transmitter) a time or frequency-varying magnetic field and measuring (with a receiver) the amplitude and phase shift of an induced secondary magnetic field. The secondary magnetic field is created by subsurface conductive materials behaving as an inductor as the primary magnetic field is passed through them.

The Geonics EM-61 system used in this investigation operates within these principles. However, the EM-61 TDEM system can discriminate between moderately conductive earth materials and very conductive metallic targets. The EM-61 consists of a portable coincident loop time domain transmitter and receiver with a 1.0-meter by 0.5-meter coil system. The EM-61 generates 150 pulses per second and measures the response from the ground after transmission or between pulses. The secondary EM responses from metallic targets are of longer duration than those created by conductive earth materials. By recording the later time EM arrivals, only the response from metallic targets is measured, rather than the field generated by the earth material.

4.2 GeoEnvironmental Soil Borings and Soil Sampling

A direct push technology (DPT) drilling rig provided by our subcontracted driller, Regional Probing Services, Inc., was used to advance soil borings across the investigation area at the locations shown on Figure 3. A utility clearance was performed by North Carolina One-Call across the investigation area. In addition to the GPR and TDEM geophysical investigations described in Section 4.1, GEL specifically cleared each planned drilling location for underground utilities utilizing radio frequency electromagnetics instrumentation.

GEL installed three soil borings to 10 feet below ground surface (bgs). The boring locations were biased toward the position of a planned NCDOT drainage structure, as shown on Figure 3. DPT soil sampling consists of pushing/hammering a stainless-steel, 4-foot long, Macro-Core soil sampler and PVC liner to the desired sampling depth. The liner is removed from the soil sampler and cut to expose a continuous soil core for characterization and sampling. Lithologic descriptions of soil samples were recorded on soil boring logs along with other field observations. The soil boring logs are provided as Appendix B. Downhole DPT equipment was decontaminated before and after each boring was constructed. The location of each boring (Figure 3) was measured using the Trimble RTK/GPS, and the borings were backfilled with bentonite chips following sample collection.

Subsurface soil was screened for organic vapors using a field photoionization detector (PID). These measurements were recorded on the soil boring logs (Appendix B) and are presented in Table 1. The PID measures the concentration of organic compounds in the vapor space above a soil sample resulting from volatilization of organic compounds contained in the soil. To screen the soils, each sample was placed in a clean, resealable polyethylene bag. The bag was sealed, the sample was allowed to equilibrate, the probe of the PID was then inserted into the bag, and the airspace above the soil was screened for organic vapors. After the soil core extracted from each boring was logged, the horizon with the highest field PID reading was selected for laboratory analysis.

To collect the sample, approximately 10 grams of soil from the selected horizon were extracted using a laboratory-provided Terra-Core sampler and transferred into a laboratory-provided VOA vial containing 20 milliliters of methanol preservative and then processed according to RED Lab field sampling protocol. Laboratory-quality nitrile gloves were worn by sampling personnel throughout the sampling process and changed between each sample. Upon collection, sample

bottles were placed on ice in a cooler and transported to the analytical laboratory under proper chain-of-custody procedures. The samples were submitted to RED Lab and analyzed by UVF Spectrometry for the following indicator parameters to evaluate the investigation area for the presence petroleum of contaminated soil:

- Total benzene, toluene, ethylbenzene, and xylenes (BTEX) (C6-C9 fraction)
- Diesel Range Organics (DRO) (C10-C35 fraction)
- Gasoline Range Organics (GRO) (C5-C10 fraction)
- Total Petroleum Hydrocarbons (TPH) (C5-C35 fraction)
- Total Aromatics (C10-C35 fraction)
- 16 EPA Polyaromatic Hydrocarbons (PAHs; total PAH value)
- Benzo(a)Pyrene.

4.3 Groundwater Sampling

As presented in Section 3.0, the depth to groundwater was measured in the existing onsite monitoring well at 8.45 feet, and moist conditions were observed toward the bottom of each of the three 10-foot deep soil borings (see Soil Boring Logs, Appendix B). Therefore, a temporary well was constructed in one boring, SB-02, to collect a groundwater sample. Based on the groundwater flow direction presented in the documents obtained from NCDEQ (see Section 2.0), SB-02 was assessed to be the boring located most directly downgradient of the former USTs. SB-02 was extended to a total depth of 17 feet bgs, and the temporary well, GW-R5819-02, was constructed according to the specifications listed in Table 2. Numerous well casing volumes were evacuated from the temporary well using a peristaltic pump with new disposable tubing prior to sample collection.

A groundwater sample was collected in laboratory-provided sample containers pre-dosed with preservatives required for the analytical parameters specified below. Laboratory-quality nitrile gloves were worn by sampling personnel throughout the sampling process. Upon collection, the sample bottles were placed on ice in a cooler and transported to the analytical laboratory under proper chain-of-custody procedures. The temporary well was then removed, and the borehole was backfilled with bentonite chips. The groundwater sample was submitted to Pace Analytical

Services for analysis of volatile organic compounds (VOCs) by EPA Method 6200B and semi-volatile organic compounds (SVOCs) by EPA Method 625.

5.0 RESULTS

The results of the geophysical surveys and the geoenvironmental soil boring and soil/groundwater sampling program are presented below.

5.1 Geophysical Survey Results

The geophysical field investigation was successfully performed at the subject parcel. Interpretation of the GPR data was conducted in the field, with subsequent data processing including band pass filtering, background removal, horizontal smoothing, and gain adjustments. TDEM was also used to scan the project site. The TDEM survey results are displayed on Figure 4. No electromagnetic or GPR anomalies were detected that were indicative of buried metallic objects that warranted marking in the field. Several high TDEM responses shown on Figure 4 are correlated to underground utilities, reinforced concrete, or surface metal structures as labeled on the figure and are not considered to be representative of "Potential USTs."

Figure 4 shows two high TDEM responses in the northwestern portion of the investigation area that are not correlated to observed surface structures. Neither of these anomalies was discernable in the field using GPR. The smaller anomaly along the western edge of the investigation area is labeled by GEL as a "no confidence" anomaly inferred as potential buried metallic debris. To the east, a slightly larger anomaly is situated at the corner of the former site building. The side-by-side images pasted below show the former building as presented in a 2004 aerial photograph along with the TDEM response pattern measured for that area. Considering the position of this anomaly in relation to the former building, GEL has labeled this feature a "low confidence anomaly", possibly representing a septic or heating oil tank. However, because there

was no subsurface structure discerned in the field using GPR, this anomaly could also be metallic debris associated with building demolition.

5.2 Soil Sample Analytical Results

The field PID screening measurements are listed in Table 1 along with a listing of the northing and easting coordinates for the boring locations. Only minor organic vapors were detected in the soil borings. The highest PID values measured across these three borings was 2.7 parts per million (ppm) in the soil sample collected from 7 to 8 feet bgs from soil boring SB-01. The soil sample collected from the horizon in each boring with the highest PID measurement were submitted to RED Lab for indicator-parameter UVF Spectrometry analysis to evaluate for the presence petroleum contaminated soil.

The UVF spectrometry analytical results for GRO, DRO, and TPH are presented in Table 1. The soil samples laboratory analytical report provided in Appendix C also presents these analytical results along with hydrocarbon fingerprint graphs prepared by RED Lab and the completed chain-of-custody form.

Consistent with the field PID measurement results, none of the samples contained elevated concentrations of petroleum hydrocarbons. The highest TPH concentration was 38.9 milligrams per kilogram (mg/Kg) reported for the soil sample from boring SB-03, which is the boring located closest to (directly south of) the former USTs. With increasing distance from the former USTs, the TPH concentrations reported for the soil samples collected from soil borings SB-02 and SB-01 are 13.5 and 1.37 mg/Kg, respectively.

The measured fractions for the hydrocarbons that fall within the GRO range of C5 through C10 ranged from 1.1 to 12 mg/Kg for the three soil samples, which are below the NCDEQ screening level for GRO of 50 mg/Kg established in a NCDEQ UST Corrective Action Branch memorandum dated 7/26/16. The measured fractions for the hydrocarbons that fall within the DRO range of C10 through C35 ranged from 0.27 to 26.9 mg/Kg for the three soil samples, which are well below the NCDEQ screening level for DRO of 100 mg/Kg. The RED Lab analytical report (Appendix C) further states that a portion of the hydrocarbons falling within the DRO range of C10 through C35 are aromatic compounds, with the total aromatic concentration reported from 0.26 to 12.5 mg/Kg. RED Lab also reports a total concentration of 0.57 mg/Kg for the boring SB-03 soil sample for the 16 EPA polynuclear aromatic hydrocarbons (PAHs) that were analyzed.

The RED Lab analytical report states that the hydrocarbon fingerprint of the soil sample collected from soil boring SB-01 matches very degraded petroleum hydrocarbon and that the hydrocarbon fingerprint of the soil sample collected from SB-03 matches very degraded diesel. No fingerprint match was identified for the soil sample collected from soil boring SB-02. Considering the Incident #10044 gasoline release occurred at least 28 years ago, a great deal of the lighter hydrocarbons likely has volatilized and degraded thus skewing the hydrocarbon pattern toward the diesel range. Therefore, the fact that Red Lab interpreted the petroleum in sample SB-03 as a very degraded diesel does not necessarily imply that the identified petroleum resulted from a release other than the Incident #10044 gasoline release.

5.3 Groundwater Sample Analytical Results

The laboratory analytical detections for groundwater sample GW-R5819-02 are listed in Table 2. The groundwater sample laboratory analytical report provided in Appendix D also presents these analytical results along with the completed chain-of-custody form. No target-analyte SVOCs were detected in the groundwater sample, but several tentatively identified compounds (TICs) were identified through an EPA Method 625.1 mass spectral library search of the gas chromatography/mass spectrometry results. As shown in Table 2, three VOCs were detected at low concentrations, ranging from 0.96 to 2.5 micrograms per liter ($\mu\text{g}/\text{L}$). The reported concentrations for the three detected VOCs are all below North Carolina 2L Groundwater Standards (15A NCAC 02L .0202) and below the NCDEQ Gross Contamination Levels (GCLs) for Groundwater (NCDEQ UST Section guidance, *Assessment and Corrective Action for UST Releases*, Table 2). Only two of the reported TICs (ethylbenzene and o-xylene) have listed 2L Groundwater Standards and GCLs, and the estimated concentrations reported for these two TICs are well below the 2L Groundwater Standards and GCLs.

6.0 CONCLUSIONS

Field and office review of the geophysical field investigation data correlated all but two identified geophysical anomalies to underground utilities, reinforced concrete, or surface metal structures. No potential anomalies were marked in the field, and the geophysical survey results suggest there are no buried metallic objects indicative of “Potential USTs” within the investigation area.

Two high TDEM responses were not discerned in the field using GPR. One feature is labeled by GEL as a “no confidence” anomaly inferred as potential buried metallic debris. The other high TDEM feature is labeled as a “low confidence anomaly,” possibly representing a septic or heating oil tank. However, because no subsurface structure was discerned in the field using GPR, this anomaly could also be metallic debris associated with building demolition.

Only minor concentrations of petroleum hydrocarbons were identified in the three soil samples and one groundwater sample. The highest soil TPH concentration of 38.9 mg/Kg and reported TPH component concentrations are below NCDEQ screening levels. All analyte concentrations reported for the groundwater sample were below 2L Groundwater Standards and GCLs.

7.0 RECOMMENDATIONS

Based on the findings of this GeoEnvironmental Phase II Investigation, no additional environmental investigation at the site is recommended at this time. A high TDEM response feature was labeled by GEL as a “low confidence anomaly,” possibly representing a septic or heating oil tank. Prior to any subsurface sitework at the location of this anomaly, it is recommended that the potential presence of a subsurface structure be verified by hand excavation. If a structure is identified, an appropriate removal and handling plan should be established and implemented. Existing monitoring well DMW-1 should be properly abandoned in accordance with 15A NCAC 02C Well Construction Standards, and care should be taken during excavation to not compromise the integrity of the previously installed MW-2 abandonment seal.

Although geophysical methods provide a high level of assurance for the location of subsurface objects, the possibility exists that not all features can or will be identified. Therefore, due caution should be used when performing subsurface excavation across the entire investigation area.

NOTES

- 1) The field survey was conducted May 11, 2021. Underground features were located using visual evidence, ground penetrating radar (GPR), and time domain electromagnetic (TDEM) methods.
- 2) Although geophysical methods provide a high level of assurance for the location of subsurface objects, the possibility exists that not all features can or will be identified due to limitations of the geophysical methods, site access, authorized scope-of-work, and/or high target congestion. Therefore, due caution should be used when performing any subsurface excavation, and GEL Engineering of NC, Inc., is not liable for any damages that may occur. Identifying the location of some structures may only be possible with vacuum or other excavation methods.
- 3) See Figure 6 for NCDOT Conventional Plan Sheet Symbol Legend. GEL Engineering of NC, Inc., is not liable for the accuracy of the base map provided by NCDOT.

Suite 106
Raleigh, NC 27616

RE: Project: NCDOT Proposal
Pace Project No.: 92538533

Dear Andrew Stahl:

Enclosed are the analytical results for sample(s) received by the laboratory on May 13, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang
bonnie.vang@pacelabs.com

QUALIFIERS

Project: NCDOT Proposal

Pace Project No.: 92538533

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

N The reported TIC has an 85% or higher match on a mass spectral library search.

R1 RPD value was outside control limits.

DIVISION: 6
DESCRIPTION: US 74/76 at SR 1740 (Old Lake Rd) Convert at grade intersection to overpass. US 74/76 (Chauncey Town Rd) convert at grade intersection to Interchange

SUBJECT: **Revision # 2 GeoEnvironmental Phase I**

The GeoEnvironmental Section of the Geotechnical Engineering Unit performed a Phase I field investigation on May 15, 2018 for the above referenced project to identify geoenvironmental sites of concern. The purpose of this report is to document sites of concern within the project study area that are or may be contaminated. These sites of concern should be included in the environmental planning document in an effort to assist the project stakeholders in reducing or avoiding impacts to these sites. Sites of concern may include, but are not limited to, underground storage tank (UST) sites, dry cleaning facilities, hazardous waste sites, regulated landfills and unregulated dumpsites.

Findings

Eleven (11) sites of concern were identified within the proposed study area. We anticipate low monetary and scheduling impacts resulting from these sites. See the following table and figure for details.

Please note that discovery of additional sites not recorded by regulatory agencies and not reasonably discernible during the project reconnaissance may occur. The GeoEnvironmental Section should be notified immediately after discovery of such sites so their potential impact(s) may be assessed.

If there are questions regarding the geoenvironmental issues, please contact me, at 919-707-6871

File

(01) Property Name:
Waccamaw Speedy Mart
104 Top Tobacco Rd
Lake Waccamaw, NC

Facility ID: 00-0-0000038785

Property Owner:
Waccamaw Outdoor Supply LLC
1306 Sam Potts Hwy
199 Central Ave
Lake Waccamaw, NC 28450

UST Owner:
Waccamaw Outdoor Supply LLC
104 Top Tobacco Rd
Lake Waccamaw, NC 28450

Anticipated Impacts: Low

This facility currently operates as an Outdoor Supply Company and a convenience store/gas station. It is located in the northwest quadrant of the Chauncey Town Rd and Top Tobacco Rd Intersection approximately 1050 feet south of US 74/76. According to the UST Section Registry there are four (4) tanks currently in use. There are no known incidents associated with this site.

(02) Property Name:

Top Tobacco
204 Top Tobacco Rd
Lake Waccamaw, NC

Property Owner:

Top Tobacco LP
204 Top Tobacco Rd
Lake Waccamaw, NC 28450

Facility ID: N/A

Incident Type/Number: N/A

UST Owner:

N/A

Anticipated Impacts: Low

This facility operates as tobacco manufacture of tobacco products. It is located on the north side of Top Tobacco Rd approximately 800 feet west of Chauncey Town Rd. The facility is not listed in the UST Section Registry and there are no know incidents associated with it.

(03) Property Name:

Sam's Pit Stop # 62
8631 Sam Potts Hwy
106 West Old Hwy 74-76
Lake Waccamaw, NC

Property Owner:

Sam's Pit Stop Properties LLC
PO Box 689
Whiteville, NC 28472

UST Owner:

Sam's Pit Stop, Inc.
702 Washington St.
Po Box 689
Whiteville, NC 28472

Facility ID: 00-0-0000011635

Incident Type/Number: N/A

Anticipated Impacts: Low

This facility currently operates as a Subway restaurant, gas station/convenience store. It is located in the northwest quadrant of Chauncey Town Rd and Sam Potts Hwy. According to the UST Section Registry there are five (5) current tanks and three tanks were removed in 1989. There are no known incidents associated with this facility.

(04) Property Name:

Vacant Lot (Boys & Girls Home Property)
8603 Sam Potts Hwy
108 West Old 74-76 Hwy
Lake Waccamaw, NC

Property Owner:

Boys & Girls Home of NC
PO Box 127
Lake Waccamaw, NC 27450

Facility ID: 00-0-0000012922

Incident Type/Number: 10044

UST Owner:

Jack Sasser
PO Box 717
Long Beach, NC 28461

Anticipated Impacts: Low

This site is currently a vacant lot. It is the former location of 74 Shell/Waccamaw Service Center. It is located on the north side of Sam Potts Hwy approximately 400 feet west of Chauncey Town Rd. According to the UST Section Registry four (4) tanks were removed in 1993. Incident # 10044 is associated with this facility and was closed out in 2003. One monitoring well was observed during the site investigation near the former UST location. The well could not be accessed and appeared to be abandoned.

(05) Property Name:

Champion Karate
8573 Sam Potts Hwy
Lake Waccamaw, NC

Property Owner:

Sonia Croom
435 Brickyard Rd
Hampstead, NC 28443

Facility ID: N/A

Incident Type/Number: N/A

UST Owner:

N/A

Anticipated Impacts: Low

This facility operates as a Karate Studio. The layout and design of the building suggest it may have operated as a gas station at one time. It is located on the north side of Sam Potts Hwy approximately 560 feet west of Chauncey Town Rd. The site is not listed in the UST Section Registry and there are no known incidents associated with it.

(06) Property Name:

Home Race Mart # 3
208 Old 74-76 Hwy
Lake Waccamaw, NC

Property Owner:

Shivam LLC
208 Old 74-76 Hwy
Lake Waccamaw, NC 28450

Facility ID: 00-0-0000035650

Incident Type/Number: N/A

UST Owner:

Shivam LLC
7824 Seven Creeks Hwy
Nakina, NC 28455

Anticipated Impacts: Low

The facility is currently an active gas station /convenience store. It is located on the northwest quadrant of Dixon St and Sam Potts Hwy. According to the UST Section Registry there are four (4) tanks currently in use. There are no known incidents associated with this facility. Several monitoring wells were observed during the site investigation.

(07) Property Name:

Former Wananish AMOCO
1306 Sam Potts Hwy
Lake Waccamaw, NC

Property Owner:

Derick O'Keith Anders Jr.
PO Box 422
Whiteville, NC 28472

Facility ID: 00-0-0000011629

Incident Type/Number: 32108

UST Owner:

Whiteville Oil Co
PO Box 48
North Myrtle Beach, SC 29597

Anticipated Impacts: Low

This facility is an inactive gas station. It is located on the northwest quadrant of Old Lake Rd and Sam Potts Hwy. According to the UST Section Registry two (2) tanks were removed in 1993 and three (3) tanks were removed in 2004. Incident # 32108 is associated with this facility and is still active. Free product and contaminated soil was observed in tank pit during the tank removal in 2004. Whiteville Oil Co has been dissolved. The site was turned over to state lead in 2016.
