ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE THAT ONLY MINOR VESTIGES OF ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET

DESCRIPTION:	Fayetteville Outer Loop from South of SR 1140 (Strickland Bridge Rd.) to South of US 401
SUBJECT:	Roadway Subsurface Investigation – Inventory

PROJECT DESCRIPTION

This project consists of 6.1 miles of proposed new roadway, realignment and widening in Cumberland County, North Carolina. A new 1.25 mile of the Fayetteville Outer Loop will be constructed from Strickland Bridge Road to south of US 401 including a full diamond interchange at the Strickland Bridge Road grade separation. Strickland Bridge Road will be realigned from Century Circle to Barefoot Road. Stoney Point Road will be widened between Barefoot Road and the new alignment of Strickland Bridge Road. Additional -Y- lines and small drives are also included at various locations.

Included in this project is a bridge structure on alignment -Y17- over alignment -L- from station 79+29 to 82+00, -Y17-. The bridge structure was investigated as a part of this roadway investigation and end bent borings are presented herein. However, the Structure Subsurface Investigation and Foundation Recommendations will be completed at a later date under a separate cover.

The investigation was conducted between January 4, 2016 and February 25, 2016 in general accordance with our Proposal to Provide Geotechnical Engineering Services, dated December 8, 2015. The recommendations provided in this report are based solely on our site reconnaissance, soil test borings and laboratory test data, engineering evaluation of these data, and generally accepted soil and foundation engineering practices and principles.

A total of eighty-one (81) borings (both Standard Penetration Test (SPT) and Hand Auger borings were drilled for the proposed roadway alignments. All SPT borings were drilled using a CME-55 ATV drill rig equipped with 2 ¼-inch inside diameter hollow-stem augers and an automatic hammer. Seven (7) additional hand auger borings were performed along minor drives and service roads due to access restrictions. Representative soil samples, collected with a split-barrel sampler or hand auger, were selected for laboratory testing to verify visual field classifications. In addition, bulk samples were collected for standard proctor compaction and California Bearing Ratio testing.

The following alignments, totaling approximately 6.1 miles were explicitly investigated.

PHYSIOGRAPHY AND GEOLOGY

The project site is in the Coastal Plain Physiographic Province of North Carolina. According to the ***Geologic Map of North Carolina*** (1985), the majority of the site is underlain by one major geologic unit in the Coastal Plain Physiographic Provence. A second major geologic unit in the Coastal Plain Physiographic Provence was encountered at the northern portion of the project site. The primary unit is Middendorf Formation (**Km**) of the Cretaceous Period. In the north, the corridor transitions to Cape Fear Formation (**Kc**) of the Cretaceous Period.

The Middendorf Formation is noted to consist of sand, sandstone, and mudstone with clay balls and iron-cemented concretions common. The beds are laterally discontinuous, with cross-bedding common. The Cape Fear Formation is noted to consist of sandstone and sandy mudstone characterized by indurated, graded and laterally continuous bedding, blocky clay, faint cross-bedding, with feldspar and mica common.

Existing site topography is generally flat with some steep slopes near creeks; typical of this area of the Coastal Plain. Drainage swales parallel existing roadway alignments, and carry roadway drainage toward various natural drainage features and creeks. Drainage ditches for agricultural use were encountered in existing agricultural fields. Topography is relatively flat in agricultural areas within the project corridor. Much of the alignment is bordered by residential and commercial properties.

SOIL PROPERTIES

A variety of soils were encountered along the project, including existing roadway embankments, artificial fills not associated with roadway construction, alluvial deposits, undivided coastal plain deposits, and coastal plain formation deposits. Areas where soils at the ground surface are of a unique geologic origin (i.e. not coastal plain soils) are approximately delineated on the boring location plans based on subsurface conditions encountered in nearby borings, and various topographical, vegetative, or other visual surface features.

Roadway Embankment soils were encountered at the ground surface beneath and adjacent to existing roadways. These consist of 3 to 5 feet of moist to wet, loose, silty sand (A-2-4).

Artificial Fill soils were encountered at one location associated with an apparent dumping site on a private property. The soils encountered consist of moist to wet, loose, silty sand (A-2-4). Various debris was noted at the ground surface in this vicinity and may extend into the subsurface.

Alluvial soils were encountered at the ground surface near the historic floodplains of natural waterways. These soils extended to depths of up to approximately 4 feet and consist of wet to saturated, very loose, silty sand (A-2-4) and wet, soft sandy silt (A-4) with trace to little amounts of organic material.

Coastal plain soils were encountered at the ground surface, or beneath fills, roadway embankments, or alluvial deposits extending to the maximum depths explored. These soils consist of dry to saturated, very loose to very dense, clayey and silty sand (A-2-6, A-2-7,A-2-4) and very soft to hard, sandy clay and silt, clayey silt and silty clays (A-4, A-6, A-7). Coastal plain soils encountered include undivided deposits, Middendorf Formation, and Cape Fear Formation deposits.

Topsoil and rootmat was encountered in grassy, brushy, and wooded areas ranging in thickness from 0.1 to 1.0 feet, and typically on the order of 0.4 to 0.7 feet.

Cultivated soils were in agricultural lands ranging in thickness from 0.3 to 1.2 feet, and typically on the order of 0.8 feet. These soils consist of wet, silty sand (A-2-4) with organic staining and some vegetative matter from recent crops.

GROUNDWATER PROPERTIES

Groundwater levels were measured at the time of boring completion, and in some cases after a waiting period of at least 24 hours. Borings drilled within and in close proximity to existing roadways, and within residential areas were backfilled immediately after completion due to safety considerations.

The project crosses small streams and tributaries as well as agricultural and roadway drainage ditches. Groundwater was observed at shallow depths near these streams and in low lying areas. In addition, many of the deeper ditches on site had standing water in them, and some low lying areas were inundated with water throughout the investigation. Detailed groundwater measurements are included in the attached subsurface profiles and cross sections, and noted areas of shallow groundwater are included in the Areas of Special Geotechnical Interest earlier in this report.

ADDITIONAL LABORATORY TESTING

The following bulk samples were obtained:

BS-1	15+49, 6'LT, -Y17RPD-	1 – 8.0	California Bearing Ratio, Standard Proctor
BS-2	15+63, 2'RT, -Y17RPA-	1 – 8.0	California Bearing Ratio, Standard Proctor
BS-3	564+00, CL, -L-	1 – 8.0	California Bearing Ratio, Standard Proctor
BS-4	48+95, 5' LT, -Y17-	1 – 6.0	California Bearing Ratio, Standard Proctor
BS-5	31+00, CL, -Y17-	1 – 7.0	California Bearing Ratio, Standard Proctor
BS-6	576+00, CL, -L-	1 – 9.0	California Bearing Ratio, Standard Proctor

Classification test results for bulk samples are included in the subsurface profiles and cross sections and Standard Proctor and California Bearing Ratio (CBR) data is attached in the Appendix.
