## 1.0 INTRODUCTION

In response to the North Carolina Department of Transportation (NCDOT) Request for Proposal, dated March 27, 2019, Wood Environment and Infrastructure Solutions, Inc. (Wood) has performed a Preliminary Site Assessment (PSA) for Parcel 609. The investigation was conducted in accordance with Wood’s Technical and Cost proposal dated April 5, 2019 and revised April 11, 2019. NCDOT contracted Wood to perform the PSA at the parcel, within the area to be affected by future road construction activities, in order to identify potential impacts from the former use of the property.

The parcel is located at 4919 East Dixon Boulevard along the northern side of East Dixon Boulevard as shown on the Vicinity Map, **Figure 1**. At the time of this PSA, the parcel was occupied by an auto repair facility (Cleveland Transmission Service). It is identified as Parcel 609 and Robert Gregory Randall (Site) within the NCDOT R-2707E design file. The parcel is in Kings Mountain of Cleveland County, North Carolina. The area of investigation within the parcel is shown on **Figure 2**.

The following report describes our subsurface field investigation at the Site and presents UVF soil analyses and volatile organic compound (VOC) laboratory analysis to evaluate soil contamination within the Site.

### 1.1 Site History

Based on our historical review, the auto repair facility has occupied the Site since the late 1980s. The Site is not identified on the North Carolina Department of Environmental Quality (NCDEQ) Underground Storage Tank (UST) Facility Database registry and no known groundwater incidents are identified at the Site. No files associated with the Site were available for review on the NCDEQ Laserfiche website.

### 1.2 Site Description

The Site is located in a mixed-use commercial and residential area of Kings Mountain in Cleveland County and covers approximately 0.93 acres. The Site is occupied by an auto repair facility (Cleveland Transmission Service) with two hydraulic lifts, discarded auto parts, five ASTs (one heating oil and four automobile oil), several 55-gallon drums, used vehicles,

---

a water-supply well, a floor drain pipe discharge located beneath a canopy-covered portion of the building, and oil-stained areas outside the building. A photographic log of the property is included as **Appendix A**.

## **2.0 GEOLOGY**

### **2.1 Regional Geology**

The Site is located within the Inner Piedmont Belt of the Piedmont Physiographic Province of North Carolina. According to the 1985 State Geologic Map of North Carolina, the area is underlain by massive to weakly foliated Cherryville Granite.

### **2.2 Site Geology**

Site geology was observed through the advancement of 20 shallow soil borings (P609-SB1 to P609-SB20). Borings P609-SB1 to P609-SB4 and P609-SB6 to P609-SB13 were advanced using a direct-push rig and targeted a total depth of four to eight feet below ground surface (bgs). Boring P609-SB7 encountered rig refusal at two feet bgs. Borings P609-SB5 and P609-SB14 to P609-SB20 were advanced using a stainless-steel hand auger due to limited rig access and targeted a total depth of three feet bgs. Boring P609-SB14 encountered refusal at 2.5 feet bgs. Figure 2 presents the boring locations and site layout. Soils encountered in the borings consisted mostly of red to tan to brown silty clays and sand. Petroleum odor and staining was observed in borings P609-SB5, P609-SB12, and P609-SB17. Groundwater was not encountered in the borings. Based on observations of topography of the Site vicinity, the groundwater flow direction is inferred to be generally to the north. Boring logs are presented in **Appendix B**.

## **3.0 FIELD ACTIVITIES**

### **3.1 Preliminary Activities**

Prior to commencing field sampling activities at the Site, several tasks were accomplished in preparation for the subsurface investigation. A Health and Safety Plan (HASP) was created

including the Site-specific health and safety information necessary for the field activities. North Carolina 811 was contacted on April 9, 2019 to report the proposed sampling activities and subsequently notify affected utilities for the parcel. Probe Utility Locating (PUL) was retained by Wood to perform utility locating and GEL Solutions (GEL) was procured by Wood to perform a geophysical survey at the Site. South Atlantic Environmental Drilling and Construction Co. Inc. (SAEDACCO) was selected to conduct the direct-push drilling services at the Site and RED Lab instrumentation was scheduled for the use in the on-site UVF analysis.

Wood understands that acquisition of the expanded right-of-way is necessary for the construction of the US 74 – Shelby Bypass. Boring locations were strategically placed within the parcel to maximize the opportunity to encounter potential contaminated soil.

### **3.2 Site Reconnaissance**

Wood personnel performed a Site reconnaissance with property owner notification on April 9, 2019. During the Site reconnaissance, the area was visually examined for the presence of any areas/obstructions that could potentially affect the subsurface investigation. An auto repair facility (Cleveland Transmission Service) with two hydraulic lifts, discarded auto parts, five ASTs (one heating oil and four automobile oil), several 55-gallon drums, used vehicles, and a water-supply well were observed at the Site.

### **3.3 Geophysical Survey Results**

The geophysical survey of the Site occurred between April 15 and 18, 2019. GEL performed a time-domain electromagnetic (TDEM) survey of the Site with a ground penetrating radar (GPR) survey conducted across select EM anomalies. The TDEM equipment was not used in areas of the Site containing numerous large metallic objects (vehicles, drums, and ASTs) because of possible interference from the objects. However, a GPR survey was still conducted in the areas where space allowed. The GEL geophysical report is presented as **Appendix C**. GEL reported five anomalies within the area of investigation with four attributed to visible cultural features at the ground surface including signs and a fence. The remaining anomaly was attributed to a potential buried utility traversing the Site. No subsurface geophysical anomalies indicating the presence of USTs were detected by GEL within the limits of the area of investigation at the Site.

---

### 3.4 Soil Sampling

On April 18, 2019, Wood and SAEDACCO mobilized to the Site to advanced 20 shallow soil borings at the Site across the area of investigation. Borings advanced via a direct-push rig were advanced to depths ranging from two to eight feet below ground surface (bgs). Borings were advanced with the rig to a minimum depth of four feet bgs (unless refusal was encountered), as sources of potential impacts were at or above the ground surface and NCDOT R-2707E design files indicate shallow soil disturbance or cutting during road construction activities. Borings that were advanced deeper (eight feet bgs) were chosen for deeper potential contaminant screening and observation of underlying soil characteristics. Borings advance via a stainless-steel hand auger were advanced to a maximum depth of three feet bgs. Borings were focused near the ASTs, drums, a floor drain discharge pipe located beneath the canopied portion of the building, used vehicles and stained areas at the Site, with a few borings spread around the Site. Soil borings were not advanced inside the building near the hydraulic lifts due to limited access caused by current operations at the Site.

The purpose of the soil sampling was to determine if a petroleum release had impacted the Site and if so, to estimate the volume of impacted soil that might require special handling during NCDOT construction activities. To minimize potential for cross-contamination between boring locations with the direct-push rig, a new PVC liner (tube) was inserted into the sampler for each soil interval and the hand auger was decontaminated between boring locations using a Liquinox<sup>®</sup> wash and distilled water rinse. Soil sampling was accompanied by field screening. Wood conducted field screening for VOCs of the soil borings with a photoionization detector (PID). The direct-push soil borings were screened with the PID at two-foot intervals while the hand auger borings were screened at one-foot intervals. A portion of the interval of the soil boring exhibiting the highest PID reading was retained for analysis of total petroleum hydrocarbons (TPH), diesel range organics (DRO), gasoline range organics (GRO), benzene, toluene, ethylbenzene, and xylene (BTEX), total aromatics, and polycyclic aromatic hydrocarbons (PAH) soil via ultraviolet fluorescence (UVF). Twenty-three total samples were collected from the Site from the borings for UVF analysis.

Portions of select samples (P609-SB5-0-1, P609-SB5-2-3, P609-SB12-0-2, and P609-SB16-0-1, and P609-SB17-0-1) were also retained for laboratory analysis and placed in laboratory provided containers and immediately placed on ice. The samples were delivered under

---

standard chain-of-custody protocol via courier to Prism Laboratories, Inc. (Prism) in Charlotte, North Carolina and analyzed for VOCs via EPA Method 8260. Five samples were collected from the borings for VOC laboratory analysis.

## 4.0 SOIL SAMPLING RESULTS

Based on PID field screening and UVF hydrocarbon analysis from April 18, 2019, evidence of petroleum hydrocarbon impacts were identified in borings P609-SB5, P609-SB12, and P609-SB17.

### 4.1 Soil Screening and UVF Analyses

PID readings for the 20 borings ranged from 2.2 parts per million (ppm) in sample P609-SB12-4-6 collected from four to six feet bgs to 117.2 ppm in sample P609-SB5-0-1 collected from the ground surface to one foot bgs. The PID field screening results are summarized in **Table 1** and provided on the boring logs in Appendix B.

Results from the UVF petroleum soil analyses are presented in **Table 2**, with instrument generated tables in **Appendix D**. Several categories of analyses were measured such as: DRO, GRO, TPH, PAHs, and total aromatics. **Figure 3** presents the GRO and DRO results at each boring.

Elevated TPH values above the NCDEQ Action Limit of 50 milligrams per kilogram (mg/kg) for GRO were not detected in the 23 samples collected from the borings. Elevated levels above the NCDEQ Action Limit of 100 mg/kg for DRO were detected in samples P609-SB5-0-1 (232.8 mg/kg) located near the drain pipe discharge, P609-SB12-0-2 (215.2 mg/kg), located near the USTs along the western exterior of the building, and P609-SB17-0-1 (159.1 mg/kg) located near the drain pipe discharge. The hydrocarbon results from the QED QROS Hydrocarbon Analyzer are provided in Appendix D.

---

## 4.2 Laboratory Analyses

The laboratory analytical report and chain-of-custody form for the soil sample laboratory analyses conducted by Prism is included in **Appendix E**. The results of the five soil samples analyzed for VOCs by Prism are summarized in **Table 3**, as well as below:

- Concentrations of 1,2,4-trimethylbenzene (12 mg/kg), 4-isopropyltoluene (1.2 mg/kg), naphthalene (0.60J mg/kg), and n-propylbenzene (3.7 mg/kg) were identified in sample P609-SB5-0-1 which exceeded their respective NCDEQ Soil-to-Water Maximum Soil Contaminant Concentrations (MSCCs). Note, the naphthalene concentration identified in soil sample P609-SB5-0-1 was J-flagged by Prism indicating the concentration was above the method detection limit but below the reporting limit and is considered an estimate.
- None of the VOC concentrations identified in the deeper sample collected from boring P-609-SB5 (P609-SB5-2-3) or the other three samples collected from the Site exceeded their respective NCDEQ MSCCs.
- None of the VOC concentrations identified in five soil samples at the Site exceeded their respective EPA Composite Worker Regional Screening Levels (RSLs).

## 5.0 CONCLUSIONS

Based on the Site observations, UVF analysis, and laboratory analysis, petroleum-impacted soil contamination was identified above the NCDEQ Action Limit of 100 mg/kg for DRO in three of the 23 samples collected from the borings advanced at the Site. Concentrations of GRO were not identified above the NCDEQ Action Limit of 50 mg/kg for GRO. In addition, the VOC laboratory analysis identified several VOC concentrations in one of the five soil samples which exceeded their respective NCDEQ Soil-to-Water MSCCs.

The areas of petroleum-impacted soils appear to be located in two areas of the site; near the floor drain pipe discharge and borings P609-SB5 and P609-SB17 and near the USTs along the western exterior of the building and boring P609-SB12. The estimated areas of

---

impacted soils are shown on **Figure 4**. The estimated impacted soil volume for the area near borings P609-SB5 and P609-SB17 is 486 cubic feet (18 cubic yards) and the volume of the area near boring P609-SB12 is 145 cubic feet (5.4 cubic yards). Both soil volumes are based on an unsaturated thickness of two feet.

## **6.0 RECOMMENDATIONS**

Based on these PSA results, Wood recommends additional interior subsurface assessment be performed at the Site near the hydraulic lifts and floor drains inside the building after the building has been vacated by the current tenant. No further assessment is recommended for the exterior subsurface of the Site, unless additional surface staining is observed after the current tenant has removed materials and containers from the Site. It is understood the areas of impacted soils are located in areas to be impacted by construction activities. Special handling should be performed during excavation in these areas and impacted soil should be disposed properly offsite.

**APPENDIX C**  
**GEOPHYSICAL REPORT**

April 29, 2019

Mr. John Maas, PG  
Wood, PLC  
2801 Yorkmont Road, Suite 100  
Charlotte, NC 28208

Re: Report for Geophysical Survey to Identify Underground Storage Tanks  
Parcel #609  
4919 E. Dixon Blvd.  
Kings Mountain, North Carolina

Dear Mr. Maas,

GEL Solutions appreciates the opportunity to provide Wood with this report of our geophysical investigation for the referenced project. This investigation was designed to determine the potential presence of underground storage tanks (USTs) at the site and underground utilities that would obstruct drilling activities at the site. The geophysical field investigation was successfully performed on April 15, 2019 through April 18, 2019.

## 1.0 Summary of Results

No subsurface anomalies were identified in the geophysical data that indicated the presence of USTs. The anomalies represented in Figure 1 are consistent with known metallic surface objects, utilities, and/or cultural interference. Although geophysical methods provide a high level of assurance for the location of subsurface objects, the possibility exists that not all features can or will be identified. Therefore, due caution should be used when performing any subsurface excavation, and GEL Solutions, LLC will not be liable for any damages that may occur. Descriptions of the technologies employed during this geophysical investigation are provided below.

## 2.0 Overview of Geophysical Investigation

The geophysical evaluation included the deployment of ground penetrating radar (GPR) and time-domain electromagnetic (TDEM) technologies to the site. These technologies were used in concert with one another in order to identify the presence of potential USTs at the site. A brief description of each technology is presented in the following paragraphs.

### Ground Penetrating Radar Methodology

An Impulse Radar digital radar control system configured with a 160-Megahertz and 600-Megahertz (MHz) antenna array was used in this investigation. GPR is an electromagnetic geophysical method that detects interfaces between subsurface materials with differing dielectric constants. The GPR system consists of an antenna which houses the transmitter and receiver, a digital control unit which both generates and digitally records the GPR data, and a color video monitor to view data as it is collected in the field.

The transmitter radiates repetitive short-duration electromagnetic waves (at radar frequencies) into the earth from an antenna moving across the ground surface. These radar waves are reflected back to the receiver from the interface of materials with different dielectric constants. The intensity of the reflected signal is a function of the contrast in the dielectric constant between the materials, the conductivity of the material through which the wave is traveling, and the frequency of the signal.

Subsurface features that commonly cause such reflections are: 1) natural geologic conditions, such as changes in sediment composition, bedding, and cementation horizons and voids; or 2) unnatural changes to the subsurface such as disturbed soils, soil backfill, buried debris, tanks, pipelines, and utilities. The digital control unit processes the signal from the receiver and produces a continuous cross-section of the subsurface interface reflection events.

GPR data profiles were collected along transects covering the entire rights of ways. Depth of investigation of the GPR signal is highly site-specific and is limited by signal attenuation (absorption) in the subsurface materials. Signal attenuation is dependent upon the electrical conductivity of the subsurface materials. Signal attenuation is greatest in materials with relatively high electrical conductivities such as clays, brackish groundwater, or groundwater with a high dissolved solid content from natural or manmade sources. Signal attenuation is lowest in relatively low conductivity materials such as dry sand or rock. Depth of investigation is also dependent on the antenna's transmitting frequency. Depth of investigation generally increases as transmitting frequency decreases; however, the ability to resolve smaller subsurface features is diminished as frequency is decreased. The average depth of penetration at this site was approximately 2-5 feet below the surface.

The GPR antenna used at this site is internally shielded from aboveground interference sources. Accordingly, the GPR response is not affected by overhead power lines, metallic buildings, or nearby objects.

#### Time Domain Electromagnetic Methodology

TDEM methods measure the electrical conductivity of subsurface materials. The conductivity is determined by inducing (from a transmitter) a time or frequency-varying magnetic field and measuring (with a receiver) the amplitude and phase shift of an induced secondary magnetic field. The secondary magnetic field is created by subsurface conductive materials behaving as an inductor as the primary magnetic field is passed through them.

The Geonics EM-61 system used in this investigation operates within these principles. However, the EM-61 TDEM system can discriminate between moderately conductive earth materials and very conductive metallic targets. The EM-61 consists of a portable coincident loop time domain transmitter and receiver with a 1.0-meter by 0.5-meter coil system. The EM-61 generates 150 pulses per second and measures the response from the ground after transmission or between pulses. The secondary EM responses from metallic targets are of longer duration than those created by conductive earth materials. By recording the later time EM arrivals, only the response from metallic targets is measured, rather than the field generated by the earth material.

### **3.0 Field Procedures and Results**

The geophysical field investigation was successfully performed on April 15 through April 18, 2019 at the referenced site located in the immediate vicinity of E. Dixon Blvd. in Kings Mountain, NC. Interpretation of the GPR data was conducted in the field and any potential anomalies were marked in the field. TDEM was also used to scan the project site with a spacing of 2.5 feet. Any electromagnetic anomalies detected during field activities that were indicative of buried metallic objects were also marked in the field. TDEM was not used within the fenced area north and east of the building due to metallic surface obstructions (vehicles and metal parts). GPR was used within the limited access area and between surface obstructions where feasible.

There were no subsurface geophysical anomalies detected within the limits of Parcel #609 during this investigation that indicated the presence of USTs. The anomalies represented in the data shown on Figure 1 are indicative of known metallic surface features and/or cultural interference.

#### 4.0 Closing

GEL Solutions appreciates the opportunity to assist Wood with this project. If you have any questions or need further information regarding the project, please do not hesitate to call me at (828) 782-3523.

Yours very truly,

Jeff Tallent  
Director of Western NC Operations

### NOTES

- 1) UNDERGROUND FEATURES WERE LOCATED USING VISUAL EVIDENCE, GROUND PENETRATING RADAR (GPR), AND TIME DOMAIN ELECTROMAGNETIC (TDEM) METHODS. OTHER BURIED FEATURES MAY EXIST BUT WERE NOT DETECTED DUE TO LIMITATIONS OF THE GEOPHYSICAL METHODS, SITE ACCESS, AUTHORIZED SCOPE-OF-WORK, AND/OR HIGH TARGET CONGESTION. THEREFORE, DUE CAUTION SHOULD BE USED WHEN PERFORMING SUBSURFACE EXCAVATION ACTIVITIES WHERE POTENTIAL CONFLICTS EXIST. GEL SOLUTIONS IS NOT RESPONSIBLE FOR DAMAGES THAT MAY OCCUR. IDENTIFYING THE LOCATION OF SOME FEATURES MAY ONLY BE POSSIBLE WITH VACUUM OR OTHER EXCAVATION METHODS.
- 2) FIELD SURVEY CONDUCTED ON 04.15.2019 - 04.18.2019.
- 3) GEOPHYSICAL DATA GENERATED USING AN IMPULSE RADAR CROSSOVER GPR SYSTEM CONFIGURED WITH A 170MHZ AND 600MHZ ANTENNA AND A GEONICS EM-61 TDEM SYSTEM. APPROXIMATE POSITIONING WAS PROVIDED USING TRIMBLE RTK/GPS.
- 4) GEL SOLUTIONS IS NOT LIABLE FOR ACCURACY OF BASE MAP PROVIDED BY WOOD.

This data package contains the analytical results for the project identified above and includes a Case Narrative, Sample Results and Chain of Custody. Unless otherwise noted, all samples were received in acceptable condition and processed according to the referenced methods.

Data qualifiers are flagged individually on each sample. A key reference for the data qualifiers appears at the end of this case narrative.

Please call if you have any questions relating to this analytical report.

Respectfully,

**PRISM LABORATORIES, INC.**

Reviewed By Robbi A. Jones  
President/Project Manager

**Data Qualifiers Key Reference:**

- ISR Internal standard response outside the QC limits. Analysis repeated without improvement. Initial result reported.
- J Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
- L Parameter reported with possible low bias. LCS recovery below the QC limit.
- SR3 Re-analysis due to high surrogate recovery resulted in similar recoveries. Matrix interference suspected. Initial result reported.
- U Not Detected at the MDL
- MDL Method Detection Limit
- RPD Relative Percent Difference
- \* Results reported to the reporting limit. All other results are reported to the MDL with values between MDL and reporting limit indicated with a J.

This report should not be reproduced, except in its entirety, without the written consent of Prism Laboratories, Inc.
