ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL. THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES 'CLUNK' SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE THAT ONLY MINOR VESTIGES OF ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

FRACTURE SPACING

TERM	SPACING
VERY WIDE	MORE THAN 10 FEET
WIDE	3 TO 10 FEET
MODERATELY CLOSE	1 TO 3 FEET
CLOSE	0.16 TO 1 FOOT
VERY CLOSE	LESS THAN 0.16 FEET

BEDDING

TERM	THICKNESS
VERY THICKLY BEDDED	4 FEET
THICKLY BEDDED	1.5 - 4 FEET
THINLY BEDDED	0.16 - 1.5 FEET
VERY THINLY BEDDED	0.03 - 0.16 FEET
THICKLY LAMINATED	0.008 - 0.03 FEET
THINLY LAMINATED	< 0.008 FEET

INDURATION

FOR SEDIMENTARY ROCKS, INDURATION IS THE HARDENING OF MATERIAL BY CEMENTING, HEAT, PRESSURE, ETC.

FRIABLE	RUBBING WITH FINGER FREES NUMEROUS GRAINS; GENTLE BLOW BY HAMMER DISINTEGRATES SAMPLE.
MODERATELY INDURATED	GRAINS CAN BE SEPARATED FROM SAMPLE WITH STEEL PROBE; BREAKS EASILY WHEN HIT WITH HAMMER.
INDURATED	GRAINS ARE DIFFICULT TO SEPARATE WITH STEEL PROBE; DIFFICULT TO BREAK WITH HAMMER.
EXTREMELY INDURATED	SHARP HAMMER BLOWS REQUIRED TO BREAK SAMPLE; SAMPLE BREAKS ACROSS GRAINS.

Project Description

The approximately 2.66-mile long project consists of realigning and widening portions of I-40 (-Y_LT-, -Y_RT-, -Y_EB-, -Y_WB-) from east of SR 1224 (Monte Vista Road) to west of SR 3412 (Sand Hill Road) and portions of I-26 (-L1_EB-, -L1_WB-) from the Pond Road Bridge to the I-26/I-40/I-240 interchange. Reconfiguration of the ramps within the existing I-26/I-40/I240 interchange will also be performed as part of the interchange improvements. Several ramps and loops (-Y5RPA-, -Y5RPB-, -Y5RPC-, -Y5RPD-, -RPC-, -RPDB-, and -RPD-) will also be widened/constructed within the project corridor.

The typical section along the I-26 (-L1-) alignments will include 4 travel lanes in each direction separated by either a median or a concrete barrier. The typical section along the I-40 (-Y-) alignments will include 5 travel lanes in each direction separated by a concrete barrier. Work within the project corridor will generally consist of retaining a majority of the existing pavement section and will include the addition of travel lanes and full depth paved shoulders.

The western portion of the project corridor, in the vicinity of the Smokey Park Highway (US 19/23) interchange, is developed and consists of a mixture of residential and commercial properties. Heading east along I-40 towards Sandhill Road, a few residential areas are located south of I-40 and the area north of I-40 is primarily wooded. The property within the existing I-26/I-40/I-240 interchange consists mainly of grassed/wooded areas. Hominy Creek parallels the east side of I-26 just south of the interchange.

A geotechnical field investigation was performed by ECS between April and May 2022. During this time period, a total of fifty-nine (59) standard penetration test (SPT) borings were advanced using a 7822DT Geoprobe drill rig equipped with an automatic hammer. Representative soil samples were collected for visual classification in the field and for analysis by ECS's testing laboratory. Representative soil samples were collected for visual classification in the field and for analysis by ECS's testing laboratory. Additionally, bulk samples were collected from the various cut areas and were used for standard Proctor and California Bearing Ratio (CBR) testing.

Between November 2003 and January 2004, NCDOT conducted a field investigation at the site. During that time period, a total of thirty-two (32) standard penetration test (SPT) borings and two (2) hand auger borings performed. Field logs were provided to ECS for use in the preparation of this report.

The following alignments were investigated. Subsurface plans, profiles and cross sections of these alignments are included in this report.

Physiography and Geology

The project site is located in the Blue Ridge Physiographic Province of North Carolina. In accordance with the Geologic Map of North Carolina, 1985, the predominant rock types in this area are mapped as muscovite-biotite gneiss. Weathered rock samples recovered from the borings typically exhibited characteristic of biotite gneiss. The virgin soils are the residual product of in-place chemical weathering of rock that was similar to the rock presently underlying the site.

Soil Properties

Soils within the area of this project have been divided into five categories: artificial fill, roadway embankment, alluvial, colluvial, and residual soils.

Artificial Fill: Materials identified as Artificial Fill (A.F.) were encountered at several locations along the project corridor. The artificial fill generally consists of very loose to loose sandy gravel (A-1-a) and very loose to loose clayey sand (A-2-7) and extend to depths of approximately 6.5 feet below existing grades.

Laboratory testing of the Artificial Fill soils indicated a Plasticity Index (PI) of Non-Plastic (NP) for the gravels (A-1-a) and a PI of 11 for the sandy soils (A-2-7).

Roadway Embankment: Roadway Embankment (R.E.) soils extend to depths up to approximately 33.6 feet below existing grades and generally consist of very loose to medium dense silty/clayey sands (A-2-4, A-2-6, A-2-7), very soft to hard sandy/clayey silt (A-4, A-5), and very soft to medium stiff sandy/silty clay (A-6, A-7-5) with various amounts of organics, mica and rock fragments throughout. Laboratory testing of the Roadway Embankment soils indicated PI's ranging from NP to 12 for the sandy soils (A-2-4, A-2-7) and PI's ranging from NP to 10 for the silty soils (A-4, A-5).

Alluvial Soils: Alluvial soils were encountered along several creeks and drainage features within the project corridor and extend to depths ranging from approximately 7.0 to 28.0 feet below existing grades. The alluvial soils generally consist of very loose to medium dense sandy gravel (A-1-a, A-1-b), very loose to medium dense silty/clayey sand (A-2-4, A-2-6), very soft to medium stiff sandy/clayey silt (A-4, A-5), and very soft to stiff sandy/silty clay (A-6, A-7-5, A-7-6) with trace organics and mica throughout. Laboratory testing of the Alluvial soils indicated a PI of NP for the silty soils (A-5) and PI's ranging from 11 to 19 for the clayey soils (A-6, A-7-6).

Colluvial Soils: Colluvial soils were encountered at several locations along the project corridor and extend to depths ranging from approximately 7.0 to 22.1 feet below existing grades. The colluvial soils generally consisted of very soft to medium stiff silty clay (A-7-5) with trace mica and rock fragments throughout.

Residual Soils: Residual soils were encountered throughout the project corridor are derived from the weathering of the underlying parent bedrock. A majority of the residual soils encountered generally consist of medium dense sandy gravel (A-1-b), very loose to very dense silty sand (A-2-4, A-2-5), very soft to hard sandy/clayey silt (A-4, A-5), and soft to very stiff sandy/silty clay (A-6, A-7-5, A-7-6) with trace to some mica and rock fragments throughout. Laboratory testing of the Residual soils indicated a PI of NP for the gravels (A-1-b), a PI of NP for the sandy soils (A-2-4, A-2-5), PI's ranging from NP to 6 for the silty soils (A-4, A-5), and PI's ranging from 11 to 30 for the clayey soils (A-6, A-7-5, A-7-6).

Rock Properties

Weathered Rock: The top of the weathered rock varied significantly along the corridor and was encountered at depths ranging from approximately 6.0 to 58.6 feet below the existing ground surface; corresponding to elevations ranging from approximately 2,107.3 feet to 2,041.7 feet. At several locations, lenses of weathered rock were encountered within the residual soil zone. The weathered rock encountered generally consists of Gneiss.

Crystalline Rock: The top of the crystalline rock varied significantly along the corridor and was encountered at depths ranging from approximately 6.0 to 68.5 feet below the existing ground surface, corresponding to elevations ranging from approximately 2,074.8 feet to 2,035.5 feet. The crystalline rock encountered consists of Gneiss.

Groundwater Properties

At the time of drilling, groundwater was encountered in six (6) of the borings drilled by ECS at depths ranging from approximately 8.3 to 11.2 feet below the existing ground surface, corresponding to elevations ranging from approximately 2,061.4 feet to 2,010.6 feet. After a stabilization period of at least 24 hours, groundwater was encountered in three (3) of the borings drilled by ECS at depths ranging from approximately 5.8 to 7.2 feet below the existing ground surface, corresponding to elevations ranging from approximately 2,019.1 feet to 2,013.5 feet. The recovered soil samples were generally described as moist above the groundwater level and moist to wet below the groundwater level.

For historical reference, thirteen (13) of the borings drilled by NCDOT in 2003-2004 encountered groundwater at depths ranging from approximately 0.4 to 30.1 feet below the existing ground surface, at the time of drilling. This corresponds to elevations ranging from 2,084.8 feet to 2,060.3 feet. After a stabilization period, groundwater was encountered in seven (7) of the NCDOT borings at depths ranging from approximately 0.0 feet to 25.2 feet, corresponding to elevations ranging from 2,088.3 feet to 2,060.8 feet.
