ROCK DESCRIPTION

HARD ROCK IS NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT REFUSAL IF TESTED. AN INFERRED ROCK LINE INDICATES THE LEVEL AT WHICH NON-COASTAL PLAIN MATERIAL WOULD YIELD SPT REFUSAL. SPT REFUSAL IS PENETRATION BY A SPLIT SPOON SAMPLER EQUAL TO OR LESS THAN 0.1 FOOT PER 60 BLOWS IN NON-COASTAL PLAIN MATERIAL, THE TRANSITION BETWEEN SOIL AND ROCK IS OFTEN REPRESENTED BY A ZONE OF WEATHERED ROCK.
ROCK MATERIALS ARE TYPICALLY DIVIDED AS FOLLOWS:

WEATHERED ROCK (WR)	NON-COASTAL PLAIN MATERIAL THAT WOULD YIELD SPT N VALUES > 100 BLOWS PER FOOT IF TESTED.
CRYSTALLINE ROCK (CR)	FINE TO COARSE GRAIN IGNEOUS AND METAMORPHIC ROCK THAT WOULD YIELD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES GRANITE, GNEISS, GABBRO, SCHIST, ETC.
NON-CRYSTALLINE ROCK (NCR)	FINE TO COARSE GRAIN METAMORPHIC AND NON-COASTAL PLAIN SEDIMENTARY ROCK THAT WOULD YEILD SPT REFUSAL IF TESTED. ROCK TYPE INCLUDES PHYLLITE, SLATE, SANDSTONE, ETC.
COASTAL PLAIN SEDIMENTARY ROCK (CP)	COASTAL PLAIN SEDIMENTS CEMENTED INTO ROCK, BUT MAY NOT YIELD SPT REFUSAL. ROCK TYPE INCLUDES LIMESTONE, SANDSTONE, CEMENTED SHELL BEDS, ETC.

WEATHERING

FRESH	ROCK FRESH, CRYSTALS BRIGHT, FEW JOINTS MAY SHOW SLIGHT STAINING. ROCK RINGS UNDER HAMMER IF CRYSTALLINE.
VERY SLIGHT (V SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED, SOME JOINTS MAY SHOW THIN CLAY COATINGS IF OPEN, CRYSTALS ON A BROKEN SPECIMEN FACE SHINE BRIGHTLY. ROCK RINGS UNDER HAMMER BLOWS IF OF A CRYSTALLINE NATURE.
SLIGHT (SLI.)	ROCK GENERALLY FRESH, JOINTS STAINED AND DISCOLORATION EXTENDS INTO ROCK UP TO 1 INCH. OPEN JOINTS MAY CONTAIN CLAY. IN GRANITOID ROCKS SOME OCCASIONAL FELDSPAR CRYSTALS ARE DULL AND DISCOLORED. CRYSTALLINE ROCKS RING UNDER HAMMER BLOWS.
MODERATE (MOD.)	SIGNIFICANT PORTIONS OF ROCK SHOW DISCOLORATION AND WEATHERING EFFECTS. IN GRANITOID ROCKS, MOST FELDSPARS ARE DULL AND DISCOLORED, SOME SHOW CLAY. ROCK HAS DULL SOUND UNDER HAMMER BLOWS AND SHOWS SIGNIFICANT LOSS OF STRENGTH AS COMPARED WITH FRESH ROCK.
MODERATELY SEVERE (MOD. SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. IN GRANITOID ROCKS, ALL FELDSPARS DULL AND DISCOLORED AND A MAJORITY SHOW KAOLINIZATION. ROCK SHOWS SEVERE LOSS OF STRENGTH AND CAN BE EXCAVATED WITH A GEOLOGIST'S PICK. ROCK GIVES "CLUNK" SOUND WHEN STRUCK. *IF TESTED, WOULD YIELD SPT REFUSAL*
SEVERE (SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC CLEAR AND EVIDENT BUT REDUCED IN STRENGTH TO STRONG SOIL. IN GRANITOID ROCKS ALL FELDSPARS ARE KAOLINIZED TO SOME EXTENT. SOME FRAGMENTS OF STRONG ROCK USUALLY REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES > 100 BPF*
VERY SEVERE (V SEV.)	ALL ROCK EXCEPT QUARTZ DISCOLORED OR STAINED. ROCK FABRIC ELEMENTS ARE DISCERNIBLE BUT MASS IS EFFECTIVELY REDUCED TO SOIL STATUS, WITH ONLY FRAGMENTS OF STRONG ROCK REMAINING. SAPROLITE IS AN EXAMPLE OF ROCK WEATHERED TO A DEGREE THAT ONLY MINOR VESTIGES OF ORIGINAL ROCK FABRIC REMAIN. *IF TESTED, WOULD YIELD SPT N VALUES < 100 BPF*
COMPLETE	ROCK REDUCED TO SOIL. ROCK FABRIC NOT DISCERNIBLE, OR DISCERNIBLE ONLY IN SMALL AND SCATTERED CONCENTRATIONS. QUARTZ MAY BE PRESENT AS DIKES OR STRINGERS. SAPROLITE IS ALSO AN EXAMPLE.

ROCK HARDNESS

VERY HARD	CANNOT BE SCRATCHED BY KNIFE OR SHARP PICK. BREAKING OF HAND SPECIMENS REQUIRES SEVERAL HARD BLOWS OF THE GEOLOGIST'S PICK.
HARD	CAN BE SCRATCHED BY KNIFE OR PICK ONLY WITH DIFFICULTY. HARD HAMMER BLOWS REQUIRED TO DETACH HAND SPECIMEN.
MODERATELY HARD	CAN BE SCRATCHED BY KNIFE OR PICK. GOUGES OR GROOVES TO 0.25 INCHES DEEP CAN BE EXCAVATED BY HARD BLOW OF A GEOLOGIST'S PICK. HAND SPECIMENS CAN BE DETACHED BY MODERATE BLOWS.
MEDIUM HARD	CAN BE GROOVED OR GOUGED 0.05 INCHES DEEP BY FIRM PRESSURE OF KNIFE OR PICK POINT. CAN BE EXCAVATED IN SMALL CHIPS TO PEICES 1 INCH MAXIMUM SIZE BY HARD BLOWS OF THE POINT OF A GEOLOGIST'S PICK.
SOFT	CAN BE GROVED OR GOUGED READILY BY KNIFE OR PICK. CAN BE EXCAVATED IN FRAGMENTS FROM CHIPS TO SEVERAL INCHES IN SIZE BY MODERATE BLOWS OF A PICK POINT. SMALL, THIN PIECES CAN BE BROKEN BY FINGER PRESSURE.
VERY SOFT	CAN BE CARVED WITH KNIFE. CAN BE EXCAVATED READILY WITH POINT OF PICK. PIECES 1 INCH OR MORE IN THICKNESS CAN BE BROKEN BY FINGER PRESSURE. CAN BE SCRATCHED READILY BY FINGERNAIL.

TIP NO.: R-5921
COUNTY: Haywood
DESCRIPTION: US 276 (Jonathan Creek Rd) from US 19 to 0.5 miles south of I-40

SUBJECT: Geotechnical Roadway Inventory Report

PROJECT DESCRIPTION

Based on a review of the plans provided to us by TGS, we understand this project consists of improvements to US 276 between US 19 in Maggie Valley and approximately 0.5 miles south of the interchange with I-40. The project is approximately 5.347 miles in length, measured along -L- (US 276) from Station 10+00 to 294+33. The work on US 276 includes the addition of a roundabout at the intersection with US 19 as well as the addition of U-turn bulbs and protected left turn lanes, roadway improvements, and associated drainage.

The vast majority of the project footprint stays within the existing roadway alignment, which is why this project was investigated primarily as a pavement investigation project. As such, only borelogs are included in this report; cross sections were not generated. In select areas, cuts and fills on the order of 5 to 10 feet will be utilized to install U-turn bulbs.

The following alignments are included as part of this investigation:

Alignment	Stations
-L- (US 276)	10+00 to 294+33
-Y- (US 19)	10+00 to 26+00

The geotechnical field investigation was conducted by CG2 during the period of November 2022 and March 2023. A subcontracted drilling crew was used to drill and sample each of the twelve (12) borings included in this report. The drill rigs utilized were a truck-mounted Mobile B-29 and an ATV-mounted CME 550X both equipped with an automatic hammer. Standard Penetration Tests (SPT) were performed at selected depths within each boring. Representative soil samples were collected for visual-manual classification in the field and evaluated in the office by a staff geologist under the supervision of a licensed engineer or geologist. Selected soil samples were submitted for laboratory analysis by an approved NCDOT M&T testing facility.

PHYSIOGRAGHY AND GEOLOGY

The project corridor is located within the Blue Ridge Physiographic Province of North Carolina. The Blue Ridge Physiographic Province generally consists of hills and ridges which are intertwined with an established system of draws, streams, and valleys. The bedrock at the project location is geologically in the Coweeta Group (ZYbn). Bedrock generally consists of migmatitic Biotite Gneiss interlayered and gradational with biotite-garnet gneiss and amphibolite, with intrusive metamorphosed gabbro and diorite.

Within the project alignment, much of the bedrock is overlain by near-surface material consisting of residual and alluvial soils. Residual soils are derived from in situ chemical and physical weathering of the rock in the area and vary in thickness. The residual soils in this region are typically finer grained with a higher clay content near the surface due to advanced weathering, and typically become coarser grained with increasing depth as the degree of weathering decreases. As the degree of weathering decreases, the residual soils generally retain the overall appearance and fabric of the parent rock (sometimes referred to as “saprolite”). The boundary between soil and rock is not always sharply defined. A transitional zone termed “weathered rock” is often found overlying the parent bedrock. Weathered rock is defined as material requiring 100 blows with less than one foot of penetration from the SPT hammer.

Alluvial soils are transported and deposited by water and are naturally variable in character, consistency/density, and often contain organic materials. Alluvial soil deposits of varying age were observed within the project alignment in low lying areas adjacent to Jonathan Creek and were encountered within borings performed for the roadway investigation. These alluvial materials contain variable amounts of rounded gravels, cobbles, and boulders, typical of older stream terrace deposits.

Soil Properties

Given the limited nature of this subsurface exploration, a generalized description of the soil and rock encountered is included below. Soils and rock encountered during the roadway investigation include roadway embankment, artificial fill, alluvial soils, residual soils, weathered rock, and crystalline rock.

Roadway Embankment soils are similar in nature to residual soils and may be derived from nearby sources. Roadway embankment soils were encountered in Boring B-06 during the roadway investigation due to the presence of state-maintained roadways. This material generally consists of hard, sandy clay (A-6), with trace amounts of mica gravel and wood fragments.

Artificial Fill soils are materials that have been moved and/or placed by man or mechanical means. Artificial fill soils were encountered in Boring B-09. The artificial fill soils generally consist of very stiff to hard, sandy silt, with trace amounts of mica and gravel.

Alluvial soils were observed in proximity to Jonathan Creek and were encountered in Borings B-02 to B-05, B-07, B-09 to B-12. The alluvial soils generally consist of medium stiff to very stiff, sandy silt (A-4) and sandy clay (A-6), and loose to very dense, silty sand (A-2-4), and sandy gravel (A-1-a). Variable amounts of gravel and mica were encountered within the alluvial soils.

Residual soils were encountered in Borings B-01, B-02, B-04, B-06, and B-08 through B-11. The residual soils generally consist of medium stiff to hard, silty clay (A-7-5) and sandy silt (A-4), and loose to very dense silty sand (A-2-4). Trace mica and rock fragments were encountered intermittently within the residual soils.

Weathered rock was encountered along the project corridor within Borings B-01 and B-03. The weathered rock consisted of Biotite Gneiss. The weathered rock was encountered at depths ranging from approximately 3.5 to 6.0 feet below existing grades at the boring locations.

Crystalline rock was encountered along the project corridor within Borings B-01, B-03, and B-05. The crystalline rock consisted of Biotite Gneiss. The crystalline rock was encountered at depths ranging from approximately 6.0 to 9.0 feet below existing grades at the boring locations.

Groundwater

Groundwater measurements were taken during November 2022 and March 2023. Groundwater measurements were attempted at the completion of drilling in each boring, at which time groundwater was encountered in Borings B-02, B-05, through B-10, and B-12 at depths ranging from approximately 4.2 to 14.3 feet below the existing grades. Subsequent groundwater measurements were attempted after at least 24 hours following the completion of drilling in Borings B-02, B-07 through B-09, and B-12. At the time of subsequent water level measurements, groundwater was encountered at depths ranging from 3.3 to 12.3 feet below existing grades. The remaining borings were either recorded as dry or filled in after drilling due to our demobilization from the project site. The soils encountered were generally described as moist to wet above and below groundwater elevation.

Water Wells: There are several residences near the project site which could indicate that water wells may be present. Water wells were not observed within the proposed construction corridor. However, wells may be encountered that were not observed during our field services.

Areas of Special Geotechnical Interest

The borings did not encounter very soft to soft or very loose to loose soils on the project.

Highly Plastic Clays: Highly plastic soils (PI > 25) were not encountered in borings of the project.

Shallow groundwater was not encountered within 3 feet of the existing ground. In addition, shallow groundwater was encountered within 6 feet of proposed subgrade at the following locations.

Geotechnical Testing

Four bulk samples were selected for laboratory testing including Atterberg limits, grain size distribution analysis with hydrometer, and natural moisture. No thin-wall Shelby tube samples were collected during the investigation.
