

# Neuse River Waterdog - Potential Habitat, July 2022 - NC Department of Transportation

## File Geodatabase Feature Class

### Tags

Neuse River waterdog, *Necturus lewisi*, Nect\_lewi, Amphibian, Aquatic, at-risk species, USFWS Bridge/culvert programmatic agreement, random forest model, machine learning, Transportation, NRTR, NCDOT, Environment, Location, North Carolina, ATLAS, North Carolina

### Summary

This dataset was originally created in February 2022 as part of the Project ATLAS initiative at NCDOT to support the Environmental Analysis Unit (EAU) Mitigation and Modeling Unit with project delivery in the development phase.

The Neuse River waterdog model is a Random Forest (machine-learning) model. Random Forest models were used to predict the probability of habitat at the scale of USGS National Hydrography Data (NHD Plus V2) catchments and their associated stream segments (median area: 272 acres; 5th and 95th percentile area: 4 acres and 1541 acres).

This dataset supports the production of the Natural Resources Technical Report (NRTR). This dataset also contains information that may assist biologists in preparing background information for field surveys, in order to address protected species for Threatened & Endangered Species Survey Reports, and/or Biological Assessments. The model is intended to be used in project management tools to:

1. flag areas of higher versus lower risk of "May Affect" biological conclusions within a species range to improve project planning and management, and
2. add a landscape-scale perspective to improve biologists' field planning and site assessment

### Description

The Neuse River waterdog Potential Habitat dataset is a polygon layer depicting high, moderate and low potential habitat locations for Neuse River waterdog in NC counties.

The Neuse River waterdog (*Necturus lewisi*) is endemic to the Tar-Pamlico and Neuse River basins in North Carolina. Its historical distribution includes the Piedmont and Coastal Plain regions of North Carolina within all major tributary systems of the Tar and Neuse, including the Trent River Basin. The Neuse River waterdog specific habitat characteristics include low to moderate gradient streams and low current velocity. It is a fully aquatic salamander, never leaving the water. It lacks lungs, getting oxygen from the water via external gills and needs clean, flowing water with high dissolved oxygen concentrations. The species dwells in streams wider than 15 meters but has been found in smaller creeks. The species thrives in cold water, and is much more active in colder seasons and when water is near-freezing. Researchers have documented activity decreasing after the water temperature rises above 18°C. waterdogs spend about 85% of the time under large granite rocks or in burrows. In early spring they move into leaf beds over mud banks on the low-energy sides of riffles and where leaves were intact or only slightly decomposed and many small critters are in the leaf litter. The Neuse River waterdog is extremely susceptible to the effects of siltation, or the deposit of sediments in freshwater. The major threats to this species arise from water development projects such as the construction of impoundments and stream channelization. Pollution from industrial and urban development can also cause loss of habitat by lowering dissolved oxygen levels and increasing suspended solids and sediments in streams. Other nonpoint sources of pollution carried into the streams by water, or runoff also affects the Neuse River waterdog.

The three levels are: Low, Moderate, and High Probability of Potential Habitat (based on similarity of environmental conditions to those found at known occurrence locations). The category thresholds were set based on the distribution of predicted values for known habitat. The High-Moderate threshold is set at the level where 90% of the observed potential habitat (species presence and reviewer judgments) falls within the High category (Presence Percent Correctly Classified). The Moderate-Low threshold were set at the level where 8% of the observed potential habitat (species presence and reviewer judgments) falls within the Moderate category and 2% within the Low category. The final thresholds for this species are 0.312 and 0.526 for the Low-Moderate and Moderate-High thresholds, respectively. Lower thresholds result in more of the range labelled as High probability of habitat and greater misclassification of known non-habitat locations. Higher thresholds result in more of the range labelled as Low probability of habitat and greater misclassification of known habitat locations.

Given the larger spatial unit of ecological models and ecological characteristics of aquatic species, the landscape scale environmental attributes of potential habitat varied greatly among sites and could closely resembled non-habitat sites. It is important to remember that potential habitat (and non-habitat) can occur at any classification level within a catchment and must be verified by a qualified biologist.

DATA QUALITY REPORT - QUANTITATIVE ATTRIBUTE ACCURACY ►

MEASURE DESCRIPTION

In addition to direct species observations, expert judgments of habitat conditions (Potential Habitat versus Non-Habitat) were gathered through desktop and field rapid site assessments.

Species experts provided feedback at two stages of model development. An early draft model was reviewed in ArcGIS Online. Completed via a desktop application, experts could scan and zoom to provide feedback on model performance based on their regional knowledge and any data layers they chose to add and view. Experts entered desktop assessments as high precision points (e.g., "this location is habitat or non-habitat") and/or low precision polygons (e.g., "this region generally provides good habitat or nonhabitat). After further development, an improved model received field validation. Field validation consisted of a rapid visual site assessment to judge a stream segment as Potential Habitat versus Non-Habitat based on evidence of stream condition and, in some cases, observation of associated species. All field validation reviews were entered as highprecision line features denoting the stream section observed.

In both reviews, time, knowledge, and/or access limitations prevented a true randomized design, but experts attempted to maximize the distribution of feedback spatially and across performance categories (True and False Positives, True and False Negatives) and to target areas with high uncertainty (high variance among models). Judgments vary in their spatial precision, including both polygons (low precision) and points and lines (high precision). Experts' judgments identify some non-habitat locations, but these are in the minority.

To ensure a balanced sample, additional catchments were randomly drawn as needed from the background (No Data catchments) to serve as pseudoabsence. Pseudoabsence catchments are unsurveyed catchments modeled treated as absence sites for the purposes of defining absence (versus presence) habitat characteristics.

## Lineage ►

### LINEAGE STATEMENT

All species' models use occurrence data from the Natural Heritage Program (NHP Tier 2 data) and the NC Wildlife Resource Commission (NCPAWS data). Species occurrence observations identified as historic (extirpated) or older than 2000 are excluded from models, as are data with low spatial accuracy (e.g., NHP Accuracy "4-Low" or "5-Very Low"). NHP "3-Medium" accuracy observations were retained and labelled as Low precision and NHP 2-High and 1-Very High accuracy observations as High precision data. The occurrence data are presence-only and are not a randomized or representative sample from the species' range. Models score any catchment with a current, moderate to high precision occurrence as "Potential Habitat".

Often multiple data records fell within a single catchment. For the purposes of modeling, to avoid pseudo-replication, duplicates were removed; each catchment was scored as potential habitat or non-habitat. Where a single catchment contained records of both potential habitat and non-habitat (OBSERVATION SET = "Conflict"), it was scored as habitat. Based on these decisions, the final model predicts the probability of any habitat within the catchment rather than the abundance of habitat within the catchment. With the available observation data (including pseudoabsence) 2766 of the 13808 catchments were classified within the species expert delineated model range.

The environmental data attributes included variables drawn from the US EPA StreamCat and the NHD Plus V2 data. From the available StreamCat data, 87 raw data variables plus 12 indices were extracted. The raw data variables primarily described local catchment characteristics across a spectrum of land cover, climatic, physiographic, hydrologic, chemical, geological, and disturbance metrics. A few of these variables provided data at finer (riparian only) and coarser (all upstream watershed area) scales. The 12 indices (six for the local catchment and six for the entire upstream watershed area) were calculated values summarizing multiple raw variables to represent the quality of aquatic habitat conditions.

#### PROCESS STEP ►

##### DESCRIPTION

Random Forest models were used to predict the probability of habitat at the scale of USGS National Hydrography Data (NHD Plus V2) catchments and their associated stream segments (median area: 272 acres; 5th and 95th percentile area: 4 acres and 1541 acres). Random Forest models generate predictions through repeated construction of decisiontree style models. At multiple points during model construction and assessment, the random forest process draws a random subset of habitat and non-habitat data and selects a random subset of the environmental variables by which to compare them.

This randomization is beneficial to reduce overfitting of the models. The model procedure tracks

- (1) how frequently sites are predicted to be habitat vs non-habitat,
- (2) which variables contributed most to accurate classification of habitat vs non-habitat sites, and
- (3) overall statistics about model performance.

The models were run in R primarily using functions from the randomForest and rfUtilities packages. Multiple random forest models were run, each initiated with a different suite of environmental (predictor) and habitat/non-habitat (response) data. Models meeting minimum performance criteria were averaged to produce a single predicted probability of habitat per catchment. These model suites included six core models, plus two additional models if associate species had been defined. "Full Set" refers to models initiated with the 87 raw environmental variables from StreamCat plus the NHD Plus environmental variables, while the "Index Set" refers to models initiated with StreamCat's 12 calculated condition indices plus NHD Plus environmental variables. For the response variable, models were run with all species observations and expert judgments ("All Habitat Data"), run with only the verified target species observations ("No Reviewer Habitat Data"), run with only the high precision observations (excluding large generalized polygons from reviewer and observation sets) ("No Low Precision Data"), and run with all habitat data for the target species plus the current, high precision observations of associate species ("Plus Associates" for species with expert identified associates).

- Full Set, All Habitat Data
- Index Set, All Habitat Data
- Full Set, No Reviewer Habitat Data
- Index Set, No Reviewer Habitat Data
- Full Set, No Low Precision Habitat Data
- Index Set, No Low Precision Habitat Data
- Full Set, Plus Associate Species Data
- Index Set, Plus Associate Species Data

The inclusion of reviewer data, low precision data, and/or associate species data did not always improve the models. Model statistical scores could be high, indicating good fit to available data, but fail to match experts' expectations based on knowledge of regional habitat variability. Also, low precision comments (large polygons) often included mixed habitat, introducing more noise than signal to the training data. Throughout the analysis, attempt was made to balance consideration of both statistical and expert assessment.

Statistics to evaluate model performance:

- Sensitivity (SENS): The proportion of known habitat correctly identified as Potential Habitat (true positive rate).
- Specificity (SPEC): The proportion of known non-habitat (including pseudoabsence) correctly identified as Non-Habitat (true negative rate).
- Area Under the Curve (AUC): A summary of overall model performance based on both sensitivity and specificity.
- Cohen's Kappa (KAPPA): A summary of overall model performance based on performance relative to a random classification.

Individual models were accepted and carried forward if they achieved values of 0.6 or greater for sensitivity, specificity, and area under the curve. For this species, the models accepted and averaged to produce the final map and statistics were: FullSet, FullSetNoLow, FullSetNoRev, Indices, IndicesNoRev.

All statistical values are to be interpreted with caution as each has unique limitations. The most informative statistic depends on the intended application and the nature of the underlying data.

**Fields ▶**

DETAILS FOR OBJECT [NeuseRiverWaterdogPotentialHabitat ▶](#)

\* TYPE Feature Class  
\* ROW COUNT 14666

DEFINITION

High, moderate and low potential habitat locations for Neuse River Waterdog in NC counties.

DEFINITION SOURCE

NCDOT

FIELD [OBJECTID ▶](#)

ALIAS OBJECTID

\* DATA TYPE OID

\* WIDTH 4

\* PRECISION 0

\* SCALE 0

\* FIELD DESCRIPTION

Internal feature number.

\* DESCRIPTION SOURCE

Esri

\* DESCRIPTION OF VALUES

Sequential unique whole numbers that are automatically generated.

*Hide Field OBJECTID ▲*

FIELD [Shape ▶](#)

\* ALIAS Shape

\* DATA TYPE Geometry

\* WIDTH 0

\* PRECISION 0

\* SCALE 0

\* FIELD DESCRIPTION

Feature geometry.

\* DESCRIPTION SOURCE

Esri

\* DESCRIPTION OF VALUES

Coordinates defining the features.

*Hide Field Shape ▲*

FIELD Mean ▶

- \* ALIAS Mean
- \* DATA TYPE Double
- \* WIDTH 8
- \* PRECISION 0
- \* SCALE 0

FIELD DESCRIPTION

Multiple random forest models were created using different data selection criteria (eg include or exclude low precision points, include or exclude reviewer desktop judgments, use raw environmental variables or composite indices, etc). Each model outputs a probability of suitable habitat value. Using all models passing statistical tests (>.6 for sensitivity, specificity, and Area under ROC Curve) Mean and Standard Deviation were calculated.

Based on the mean, the thresholds for the bins (Low, Moderate, High probability) were calculated.

DESCRIPTION SOURCE

NCDOT

*Hide Field Mean ▲*

FIELD SD ▶

- ALIAS StandardDeviation
- \* DATA TYPE Double
- \* WIDTH 8
- \* PRECISION 0
- \* SCALE 0

FIELD Shape\_Length ▶

- \* ALIAS Shape\_Length
- \* DATA TYPE Double
- \* WIDTH 8
- \* PRECISION 0
- \* SCALE 0

\* FIELD DESCRIPTION

Length of feature in internal units.

\* DESCRIPTION SOURCE

Esri

\* DESCRIPTION OF VALUES

Positive real numbers that are automatically generated.

[Hide Field Shape\\_Length ▲](#)

FIELD Shape\_Area ►

- \* ALIAS Shape\_Area
- \* DATA TYPE Double
- \* WIDTH 8
- \* PRECISION 0
- \* SCALE 0
- \* FIELD DESCRIPTION  
Area of feature in internal units squared.
- \* DESCRIPTION SOURCE  
Esri
- \* DESCRIPTION OF VALUES  
Positive real numbers that are automatically generated.

## Metadata Constraints ►

SECURITY CONSTRAINTS

CLASSIFICATION unclassified

CLASSIFICATION SYSTEM None

LIMITATIONS OF USE

The North Carolina Department of Transportation shall not be held liable for any errors in this metadata. This includes errors of omission, commission, errors concerning the content of the data, and relative and positional accuracy of the data. This data cannot be construed to be a legal document. Primary sources from which this data was compiled must be consulted for verification of information contained in this data. Datasets developed under Project ATLAS do not replace any NRTR work for future projects and may not be used as a replacement for site visits / field surveys by qualified professionals and hence should be used only as a supporting platform for decision making. Use of this dataset for project scoping or screening is merely pre-decisional.
