

Version Documentation for EDMCheq

Prior to version 1.0.0.2 there was no documentation kept on versioning or release dates.

Version 1.0.0.2 – Release date 12/17/15

- 1) Version number was added to the 'About' dialog box.
- 2) The Published baseline Name or file was added to the final report. The observed file name was added to the final report.
- 3) How the data was processed changed. Now, all multiple distances between the same monument are averaged and only a single averaged distance is used in the statistical least squares processing.
- 4) The Salisbury baseline data found in the file baselines.dat file had some errors. The distance between SALISPORT & 1050 was listed as 049.9998 instead of 1049.9998. The data line '2:430,1050,620.0011' was incorrectly listed as '2:150,1050,620.0011'.

Version 1.0.0.3 – Release date 10/04/16

- 1) Small changes were made to the report to make sure that the PC version report and the TSC3 report are identical. Changes included making sure the number and position of CR/LF's are identical. Also made sure the error message about scale error was identical.
- 2) The RMS of the 'Diff' column was added to the report.
